

**Batch: BCT\_1      Roll No.: 1911027**

**Experiment No. 1**

**Title: Block chain demo and Block explorer – Bitcoin and Ethereum and Test Networks**

**Objective:** To explore the contents of blocks in blockchain, get insights into the working of blockchain using online blockchain creation platforms and also access the test networks.

**Expected Outcome of Experiment:**

CO	Outcome
CO1	<b>Build your own Blockchain businesses with acquired knowledge.</b>

**Abstract:-**

A blockchain is a type of Digital Ledger Technology (DLT) that consists of growing list of records, called blocks, that are securely linked together using cryptography. Each block contains a cryptographic hash of the previous block, a timestamp, and transaction data (generally represented as a Merkle tree, where data nodes are represented by leaf's). The timestamp proves that the transaction data existed when the block was created. Since each block contains information about the block previous to it, they effectively form a chain (compare linked list data structure), with each additional block linking to the ones before it. Consequently, blockchain transactions are irreversible in that, once they are recorded, the data in any given block cannot be altered retroactively without altering all subsequent blocks.

**Related Theory: -**

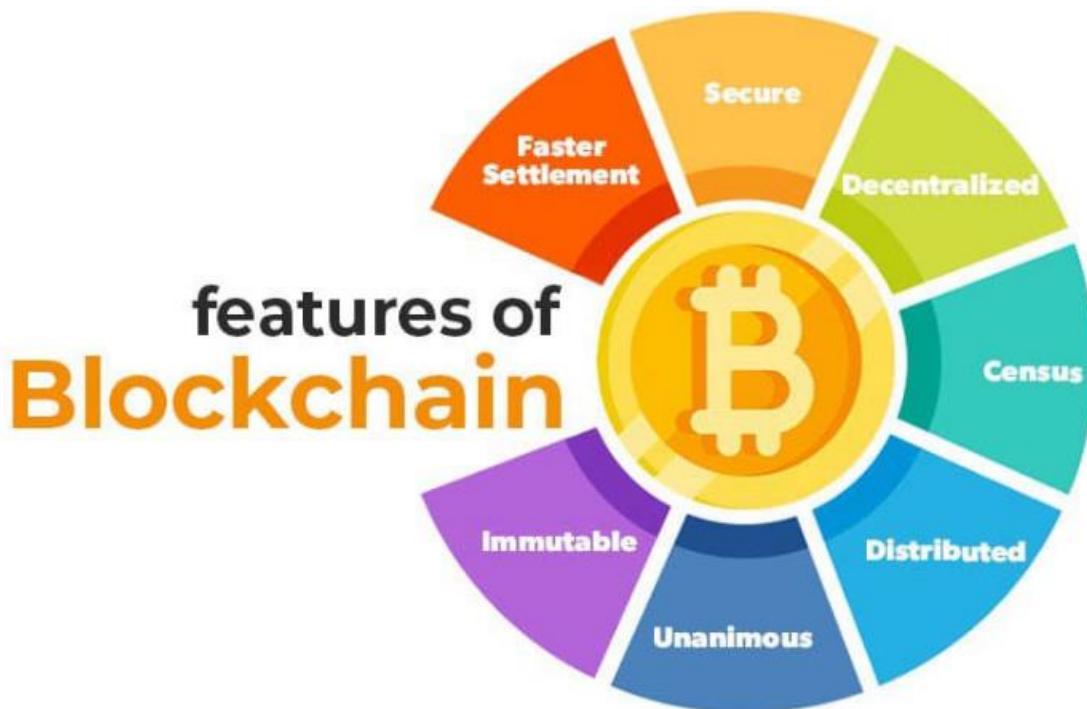

Blockchain is a method of recording information that makes it impossible or difficult for the system to be changed, hacked, or manipulated. A blockchain is a distributed ledger that duplicates and distributes transactions across the network of computers participating in the blockchain. Blockchain technology is a structure that stores transactional records, also known as the block, of the public in several databases, known as the “chain,” in a network connected through peer-to-peer nodes. Typically, this storage is referred to as a ‘digital ledger.’ Every transaction in this ledger is authorized by the digital signature of the owner, which authenticates the transaction and safeguards it from tampering. Hence, the information the digital ledger contains is highly secure. In simpler words, the digital ledger is like a Google spreadsheet shared among numerous computers in a network, in which, the transactional records are stored based on actual purchases. The fascinating angle is that anybody can see the data, but they can't corrupt it.

Suppose you are transferring money to your family or friends from your bank account. You would log in to online banking and transfer the amount to the other person using their account number. When the transaction is done, your bank updates the transaction records. It seems simple enough, right? There is a potential issue which most of us neglect. These types of transactions can be tampered with very quickly. People who are familiar with this truth are often wary of using these types of transactions, hence the evolution of third-party payment applications in recent years. But this vulnerability is essentially why Blockchain technology was created. Technologically, Blockchain is a

digital ledger that is gaining a lot of attention and traction recently. But why has it become so popular? Well, let's dig into it to fathom the whole concept. Record keeping of data and transactions are a crucial part of the business. Often, this information is handled in house or passed through a third party like brokers, bankers, or lawyers increasing time, cost, or both on the business. Fortunately, Blockchain avoids this long process and facilitates the faster movement of the transaction, thereby saving both time and money.

**Features of Blockchain:**

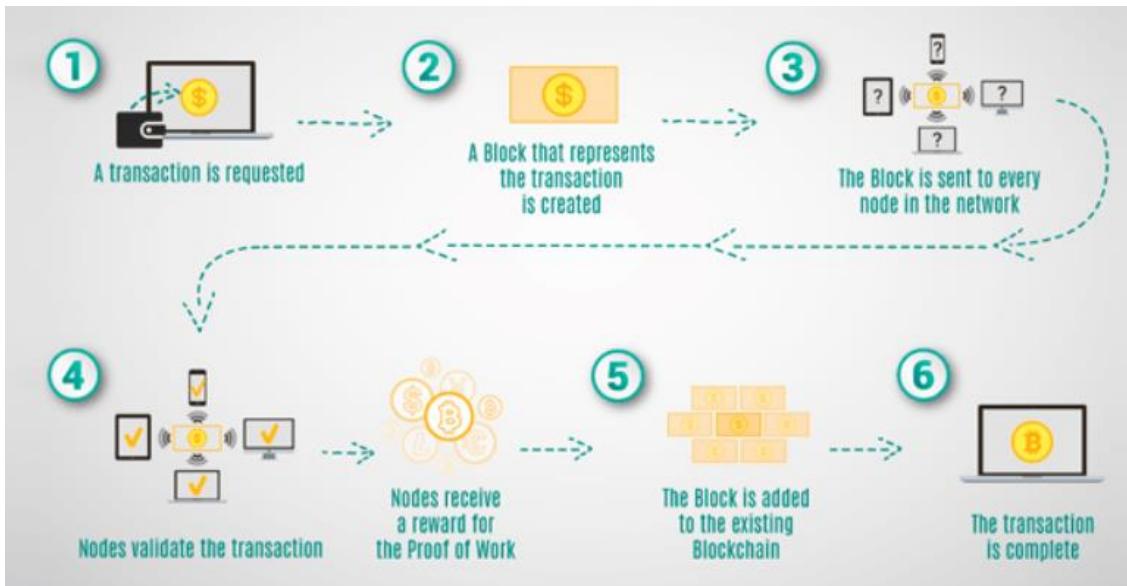

- 1) **Immutable:** Immutability means that the blockchain is a permanent and unalterable network. Blockchain technology functions through a collection of nodes. Every node in the network has a copy of the digital ledger. To add a transaction every node checks the validity of the transaction and if the majority of the nodes think that it is a valid transaction then it is added to the network. This means that without the approval of a majority of nodes no one can add any transaction blocks to the ledger.
- 2) **Distributed:** All network participants have a copy of the ledger for complete transparency. A public ledger will provide complete information about all the participants on the network and transactions. The distributed computational power across the computers ensures a better outcome. Distributed ledger is one of the important features of blockchains due to many reasons like: In distributed ledger tracking what's happening in the ledger is easy as changes propagate

**Department of Computer Engineering**

really fast in a distributed ledger. Every node on the blockchain network must maintain the ledger and participate in the validation.

- 3) **Decentralized:** The blockchain network is decentralized which means that there is no central governing authority that will be responsible for all the decisions. Rather a group of nodes makes and maintains the network. Each and every node in the blockchain network has the same copy of the ledger. Decentralization property offers many advantages in the blockchain network: As a blockchain network does not depend on human calculations it is fully organized and fault-tolerant.
- 4) **Secure:** All the records in the blockchain are individually encrypted. Using encryption adds another layer of security to the entire process on the blockchain network. Since there is no central authority, it does not mean that one can simply add, update or delete data on the network. Every information on the blockchain is hashed cryptographically which means that every piece of data has a unique identity on the network. All the blocks contain a unique hash of their own and the hash of the previous block. Due to this property, the blocks are cryptographically linked with each other.
- 5) **Consensus:** Every blockchain has a consensus to help the network to make quick and unbiased decisions. Consensus is a decision-making algorithm for the group of nodes active on the network to reach an agreement quickly and faster and for the smooth functioning of the system. Nodes might not trust each other but they can trust the algorithm that runs at the core of the network to make decisions. There are many consensus algorithms available each with its pros and cons. Every blockchain must have a consensus algorithm otherwise it will lose its value.
- 6) **Unanimous:** All the network participants agree to the validity of the records before they can be added to the network. When a node wants to add a block to the network then it must get majority voting otherwise the block cannot be added to the network. A node cannot simply add, update, or delete information from the network. Every record is updated simultaneously and the updatations propagate quickly in the network. So it is not possible to make any change without consent from the majority of nodes in the network.
- 7) **Faster Settlement:** Traditional banking systems are prone to many reasons for fallout like taking days to process a transaction after finalizing all settlements, which can be corrupted easily. On the other hand, blockchain offers a faster settlement compared to traditional banking systems. This blockchain feature helps make life easier.

### How Does Blockchain Technology Work?

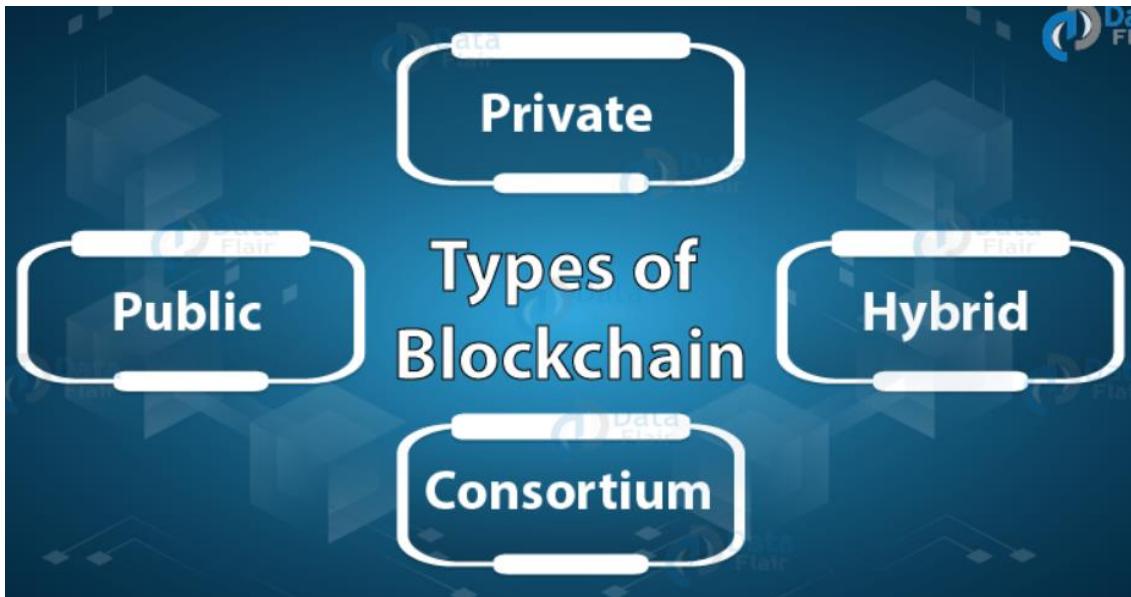

Blockchain is a combination of three leading technologies:

- Cryptographic keys
- A peer-to-peer network containing a shared ledger
- A means of computing, to store the transactions and records of the network

Cryptography keys consist of two keys – Private key and Public key. These keys help in performing successful transactions between two parties. Each individual has these two keys, which they use to produce a secure digital identity reference. This secured identity is the most important aspect of Blockchain technology. In the world of cryptocurrency, this identity is referred to as ‘digital signature’ and is used for authorizing and controlling transactions. The digital signature is merged with the peer-to-peer network; a large number of individuals who act as authorities use the digital signature in order to reach a consensus on transactions, among other issues. When they authorize a deal, it is certified by a mathematical verification, which results in a successful secured transaction between the two network-connected parties. So to sum it up, Blockchain users employ cryptography keys to perform different types of digital interactions over the peer-to-peer network.

**Types of Blockchain:**

- **Private Blockchain:** Private blockchains operate on closed networks, and tend to work well for private businesses and organizations. Companies can use private blockchains to customize their accessibility and authorization preferences, parameters to the network, and other important security options. Only one authority manages a private blockchain network.
- **Public Blockchain:** Bitcoin and other cryptocurrencies originated from public blockchains, which also played a role in popularizing distributed ledger technology (DLT). Public blockchains also help to eliminate certain challenges and issues, such as security flaws and centralization. With DLT, data is distributed across a peer-to-peer network, rather than being stored in a single location. A consensus algorithm is used for verifying information authenticity; proof of stake (PoS) and proof of work (PoW) are two frequently used consensus methods.
- **Hybrid Blockchain:** A hybrid blockchain is a unique type of blockchain technology that amalgamates components of both public and private blockchain or tries to utilise the ideal part of both public and private blockchain solutions. Transactions and records in a hybrid blockchain are made private but can be verified when entailed, such as by enabling access through a smart contract. Private information is kept inside the network but is still verifiable.
- **Consortium Blockchains:** Similar to permissioned blockchains, consortium blockchains have both public and private components, except multiple organizations will manage a single consortium blockchain network. Although these types of blockchains can initially be more complex to set up, once they are

**Department of Computer Engineering**

running, they can offer better security. Additionally, consortium blockchains are optimal for collaboration with multiple organizations.

**Challenges:**

- **Platform:** Standards or protocols are needed to govern scalability (block size versus average bandwidth enjoyed by users), energy consumption, stability (switching from proof of work to proof of stake), and robustness of the network infrastructure in order to assure the long-term success.
- **Applications:** Some oversight is needed to ensure user-friendly interfaces and how to increase the pool of skilled developers.
- **Legal structure for stewardship:** The ecosystem needs a governance body to coordinate on matters such as interoperability, privacy, security, protection of identity, and actions to reduce the amount of legal uncertainty surrounding emergent technologies. They need to spur more investments in research and confront incoming challenges from legacy operators and hackers that exploit open source coding to commit terrorist acts.

**Advantages:**

- **Verifiable:** Blockchain technology is used to store information in a decentralized manner so everyone can verify the correctness of the information by using zero-knowledge proof through which one party proves the correctness of data to another party without revealing anything about data.
- **Permanent:** Records or information which is stored using blockchain technology is permanent means one needs not worry about losing the data because duplicate copies are stored at each local node as it is a decentralized network that has a number of trustworthy nodes.
- **Free from Censorship:** Blockchain technology is considered free from censorship as it does not have control of any single party rather it has the concept of trustworthy nodes for validation and consensus protocols that approve transactions by using smart contracts.
- **Tighter Security:** Blockchain uses hashing techniques to store each transaction on a block that is connected to each other so it has tighter security. It uses SHA 256 hashing technique for storing transactions.

**Disadvantages:**

- **Scalability:** It is one of the biggest drawbacks of blockchain technology as it cannot be scaled due to the fixed size of the block for storing information. The

**Department of Computer Engineering**

block size is 1 MB due to which it can hold only a couple of transactions on a single block.

- **Immaturity:** Blockchain is only a couple-year-old technology so people do not have much confidence in it, they are not ready to invest in it yet several applications of blockchain are doing great in different industries but still it needs to win the confidence of even more people to be recognized for its complete utilization.
- **Energy Consuming:** For verifying any transaction a lot of energy is used so it becomes a problem according to the survey it is considered that 0.3 percent of the world's electricity had been used by 2018 in the verification of transactions done using blockchain technology.
- **Time-Consuming:** To add the next block in the chain miners need to compute nonce values many times so this is a time-consuming process and needs to be speeded up to be used for industrial purposes.

**Applications:**

- **Financial Services:** Bitcoin is the first and most prominent application of block chain technology as an e-payment system. Bitcoin was created in January 2009 by Satoshi Nakamoto as a digital currency independent of any central authority, transferable electronically, and with very low transaction costs. A stable and widely accepted crypto currency stands to revolutionize e-commerce, money transfers, and even letters of credit. Cryptocurrency poses a challenge to traditional banking.
- **Retail and Services:** It can be used in retail and services. Any merchant who accepts digital money as payment can exchange their goods and services. Persons and companies involved in a supply value chain can use private block chains to reduce transaction costs in their business relationships and make payments and transfers along the chain as well as pass information in a very transparent manner.
- **Digital Identity:** Identity theft is emerging as a bane of the digital age. Currently taking precautions against identify theft and attempting to restore identity after it has been compromised is an \$18.5 billion annual business and growing yearly according to Distil Networks. Using blockchain technologies would make the tracking and managing of digital identities both secure, efficient and low-cost.
- **Digital Voting:** Two of the biggest hurdles to electronic poll place machines and online voting is the fear that security can be breached and that votes can be manipulated. Using blockchain, a voter could verify if his or her vote was

**Department of Computer Engineering**

successfully transited and remain anonymous and because of the distributed ledger technology it would not be possible to alter a vote once casted.

**Bitcoin:**

There are a number of currencies in this world used for trading amenities. Rupee, Dollar, Pound Euro and Yen are some of them. These are printed currencies and coins and you might be having one of these in your wallet. But bitcoin is a currency you cannot touch, you cannot see but you can efficiently use to trade amenities. It is an electronically stored currency. It can be stored in your mobiles, computers or any storage media as a virtual currency. Bitcoin is an innovative and digital payment system. It is an example of a cryptocurrency and the next big thing in finance.

**How Bitcoin Transactions work?**

Bitcoin transactions are digitally signed for security. Everyone on the network gets to know about a transaction. A transaction contains 3 pieces of information . The first part contains the bitcoin wallet address of the sender, the second part contains the amount that has been sent, and the third part contains the bitcoin wallet address of the recipient. A bitcoin can also be considered as an invisible currency with only the transaction records between different addresses. Every transaction ever made using Bitcoin is stored in a public ledger called a Blockchain.

**Components Of Bitcoin:**

There are four basic components of bitcoin:

- Software

**Department of Computer Engineering**

- Cryptography
- Hardware
- Miners(Gaming Theory)

**1. Software:** Bitcoin is, at its heart, a piece of software that defines what a bitcoin is and how it is transmitted. Checking of validity or who is allowed or not allowed to be within bitcoin etc. Type of the regulations of a legitimate bitcoin is established via it. Everything is run by software, which in this case is the bitcoin program. The bitcoin program is always available 24 hours a day, seven days a week.

**2. Cryptography:** Cryptography and bitcoin as a cryptocurrency are at the heart of the software. Bitcoin regulates both the transfer of bitcoin between parties and the production of new bitcoin units using encryption. Bitcoin would not be conceivable without cryptography. So, we've established that this software use cryptography to regulate bitcoin transfers across the internet. Cryptography is a mathematical approach that can only be solved by machines, not people. Cryptography is required to safeguard the data.

**3. Hardware:** Cryptography demands a lot of hardware to run and solve. This gear has been created specifically for mining, i.e. detecting Nonce to validate blocks and hashes. To accomplish a simple activity on the bitcoin blockchain, a lot of CPU power is required. If one tries to mine bitcoin with a smartphone or home computer right now, you'll lose your computer and rack up a large electric bill.

**4. Miners(Gaming Theory):** Game theory studies rational decision-making behaviour in humans. Game theory allows interactions between two or more players in a system where the participant's outcome is based on the actions of the others. Every participant's aim is to maximize his gain. The game theory is used by bitcoin to ensure that rational individuals align their interests in a certain way. They impact the network's miners' interactions and behaviour in particular.

**Implementation Details:**

**1. Enlist all the Steps followed and various options explored**

→ Steps:

Blockchain demo: [Link](#)

1) Important concept related to blockchain is the integrity and it can be preserved using hashes. SHA256 algorithm is one of the most extensively used algorithm in blockchain applications.

### SHA256 Hash

A screenshot of a web-based SHA256 hash calculator. It has two main sections: 'Data:' and 'Hash:'. The 'Data:' section contains a large text area where the string 'BCT1  
1911027  
Nayan Mandliya' is entered. Below it, the 'Hash:' section displays the resulting SHA256 hash: 'e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855'.

2) As seen from the image given above there are 2 sections, first one is the data and the second one is the hash of the data. Now if we change data the hash will be recomputed using SHA256 algorithm.

### SHA256 Hash

A screenshot of a web-based SHA256 hash calculator. The 'Data:' section now contains the string 'BCT1  
1911027  
Nayan Mandliya'. The 'Hash:' section shows the new SHA256 hash: 'f8c696fc549b89d1bd621ebfd95faed5ca5fb8bc63313ffff490e113e95deb612'.

3) At the top layer a block in the blockchain consists of block number, nonce (used for verification), data and hash of the current block.

### Block

A screenshot of a web-based blockchain simulation tool. It shows a single block with the following fields:  
 - Block: # 1  
 - Nonce: 72608  
 - Data: (empty text area)  
 - Hash: 0000f727854b50bb95c054b39c1fe5c92e5ebcf4bc5dc279f56aa96a365e5a  
 A blue 'Mine' button is located at the bottom left of the block's input area.

4) Whenever any of the above fields are changed blocks become invalid and that block has to be remined so that it can become valid and can be added in the blockchain. When any of the fields of the block is changed then nonce has to be recomputed to match the difficulty level in hash (proof of work, 4 leading 0's in this case).

### Block

Block:	# 1
Nonce:	72608
Data:	Nayan Mandliya BCT1 1911027
Hash:	c791b78620fdfd6671bc671df39ad7ea1b6be05a66e1d2d5eee1fc2294768f2
<b>Mine</b>	

5) The block becomes red as the data is changed and hash is not defining proof of work so this block again has to be mined to become valid (recomputation of nonce to satisfy proof of work).

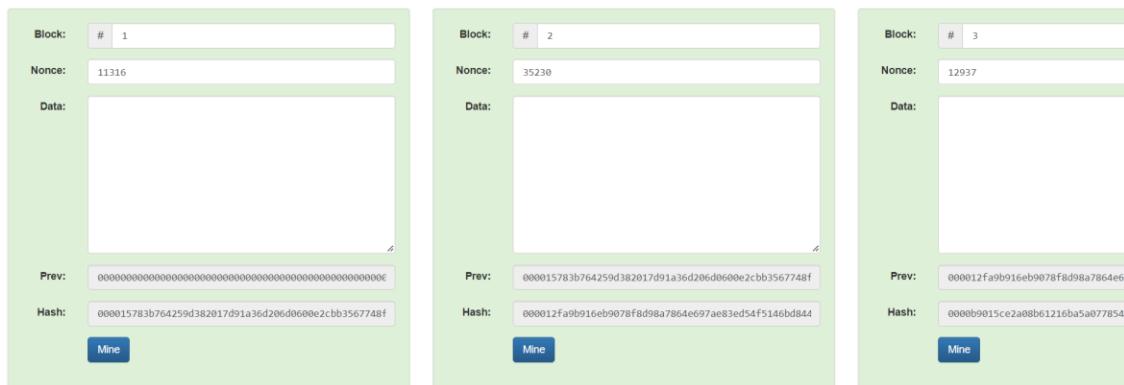

### Block

Block:	# 1
Nonce:	19643
Data:	Nayan Mandliya BCT1 1911027
Hash:	0000a9522186a731f843b0554741a76b7d1d3de0d036041c968375efe733a689
<b>Mine</b>	

6) Blockchain as a whole is just the connection of blocks in the linked list manner. All the blocks contains some amount of data as defined in above steps. All the links blocks will have copy of data of everyother block in the blockchain. Whenever any other block is added to the blockchain all the existing nodes in the blockchain will be informed about that and if 51% of blocks gives their confirmation that newly added block is valid then only new block will be added to the blockchain and its information will be provided to all the other blocks in the blockchain.

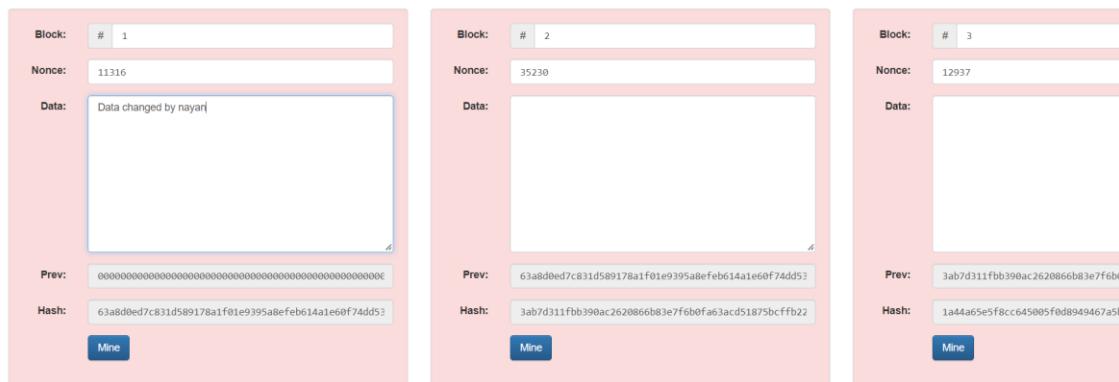

**Department of Computer Engineering**

**Blockchain**

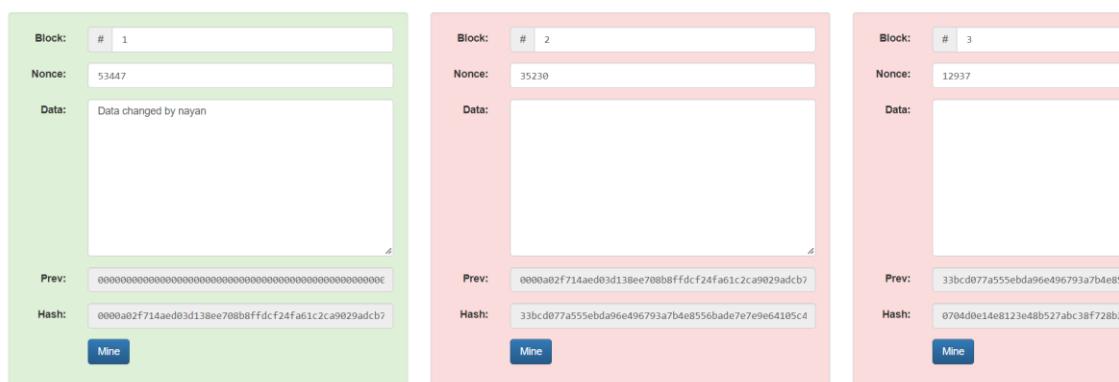

7) Now we have changed the data of block1 and it can be seen that all the blocks have turned red, i.e. all the blocks are now invalid in this block chain.

**Blockchain**

8) In real scenario data in the blocks of the blockchain can't be changed. Now to make blocks again valid we have to first mine the block after which all the blocks are invalid (block number 1 in our case).

**Blockchain**

9) First block is now validated now similarly we have to mine all the other blocks in the blockchain.

16) All transactions that take place on the cryptocurrency network are not the result of payment between two people. Some transactions are a little bit different. The first transaction that took place was in Bitcoin. It was a special transaction that formatted reward transactions for miners inside the genesis block (the very first block of a blockchain). Such reward transactions are specially allocated to the miner for their work. This type of transaction is known as a Coinbase transaction. These type of transactions generates new currencies that have never been spent.

## Blockchain demo2: Link

1) Blockchain is basically a peer to peer network. Every block in the blockchain has the information of every other block in the blockchain. Now to demonstrate peer to peer nature of block chain we have another tool (link mentioned in the title). First block in the blockchain is called as the genesis block. Name of the peer (Satoshi) can be seen on top. We can add block in to the existing blockchain as well as we can add another peers. Peers can also be connected using the tool described.

**PEERS**

Satoshi

**BLOCKCHAIN**

DATA Nayan Mandliya 1911027

PREVIOUS HASH 0

HASH 00096613865166ff4c7b6f56ced262039d36d8928eb6248cc5397f04562a4234

GENESIS BLOCK on Sun, 11 Sep 2022 18:56:36 GMT 2739

2) Now we will add a block in the Satoshi's blockchain.

**BLOCKCHAIN**

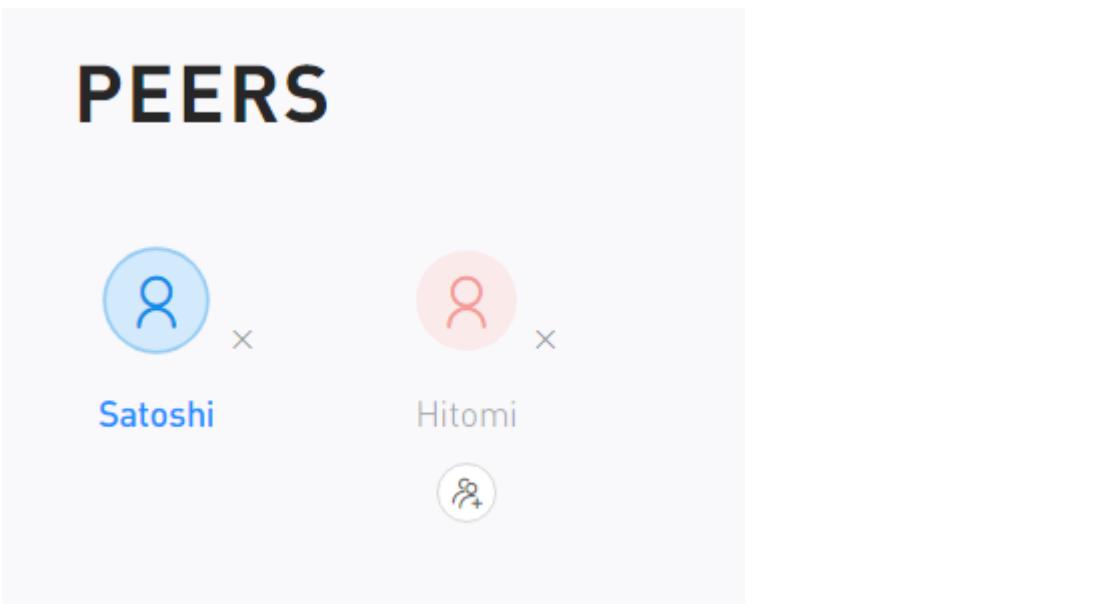

DATA Block2 of satoshi

PREVIOUS HASH 00096613865166ff4c7b6f56ced262039d36d8928eb6248cc5397f04562a4234

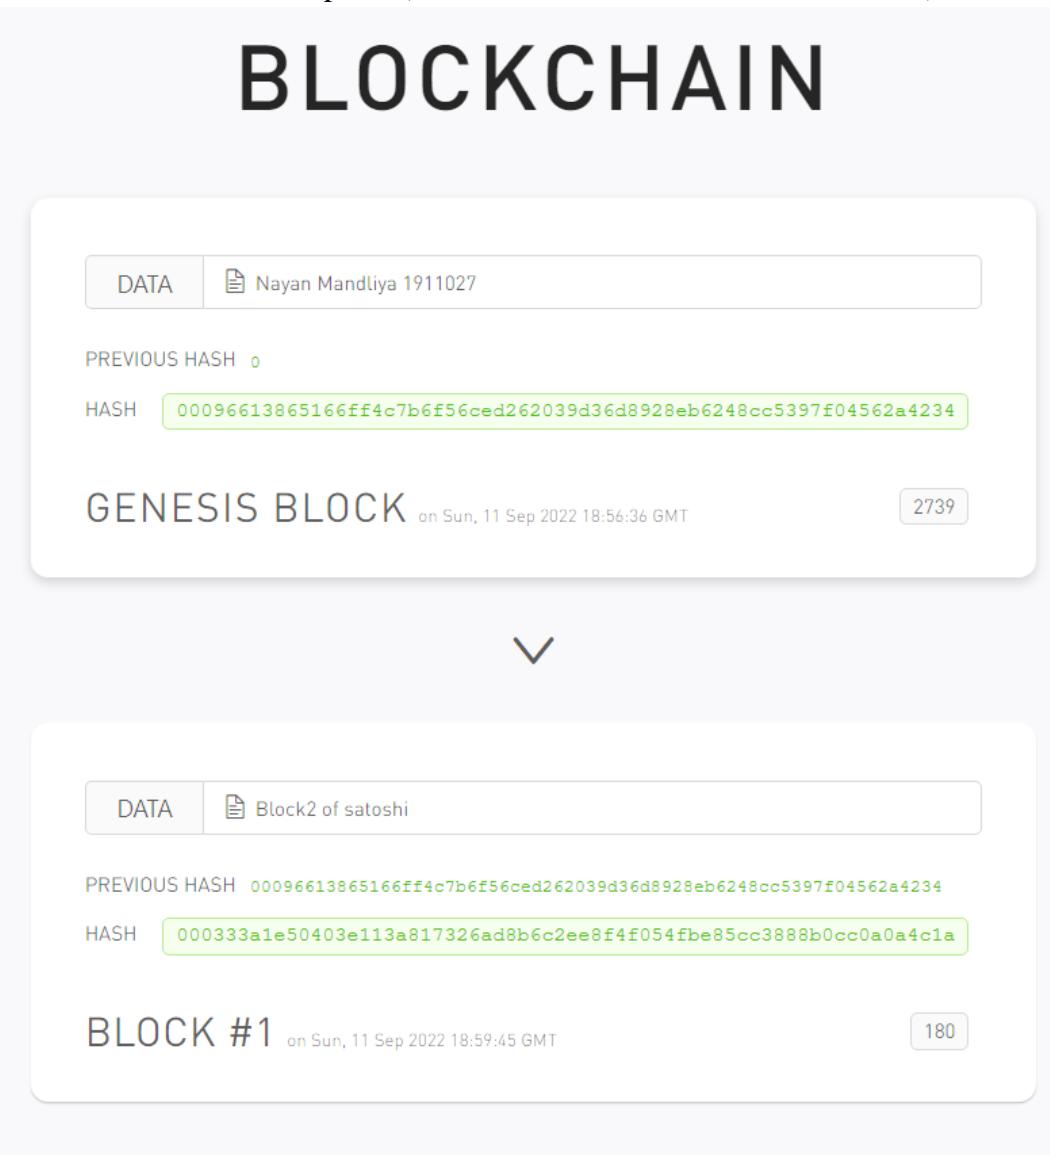

HASH 000333a1e50403e113a817326ad8b6c2ee8f4f054fbe85cc3888b0cc0a0a4c1a

BLOCK #1 on Sun, 11 Sep 2022 18:59:45 GMT 180

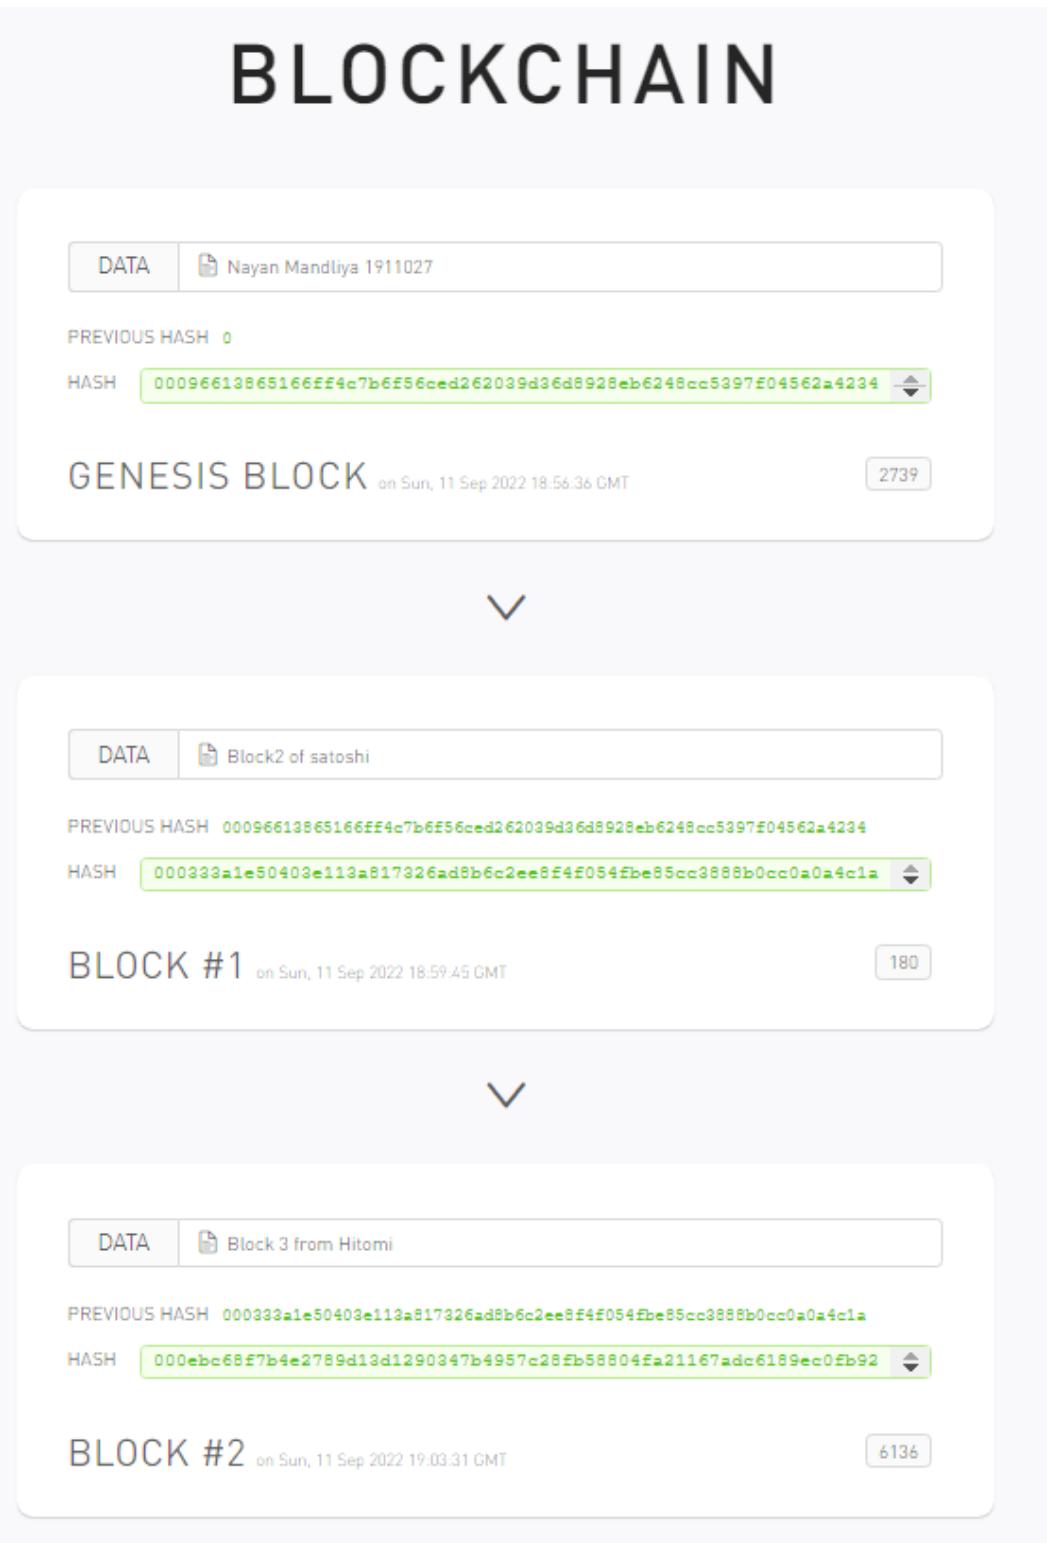

3) We can also create another peer by “add peer” button present on top right corner.

4) We can also connect the peers (click the + icon at the bottom of Hitomi).

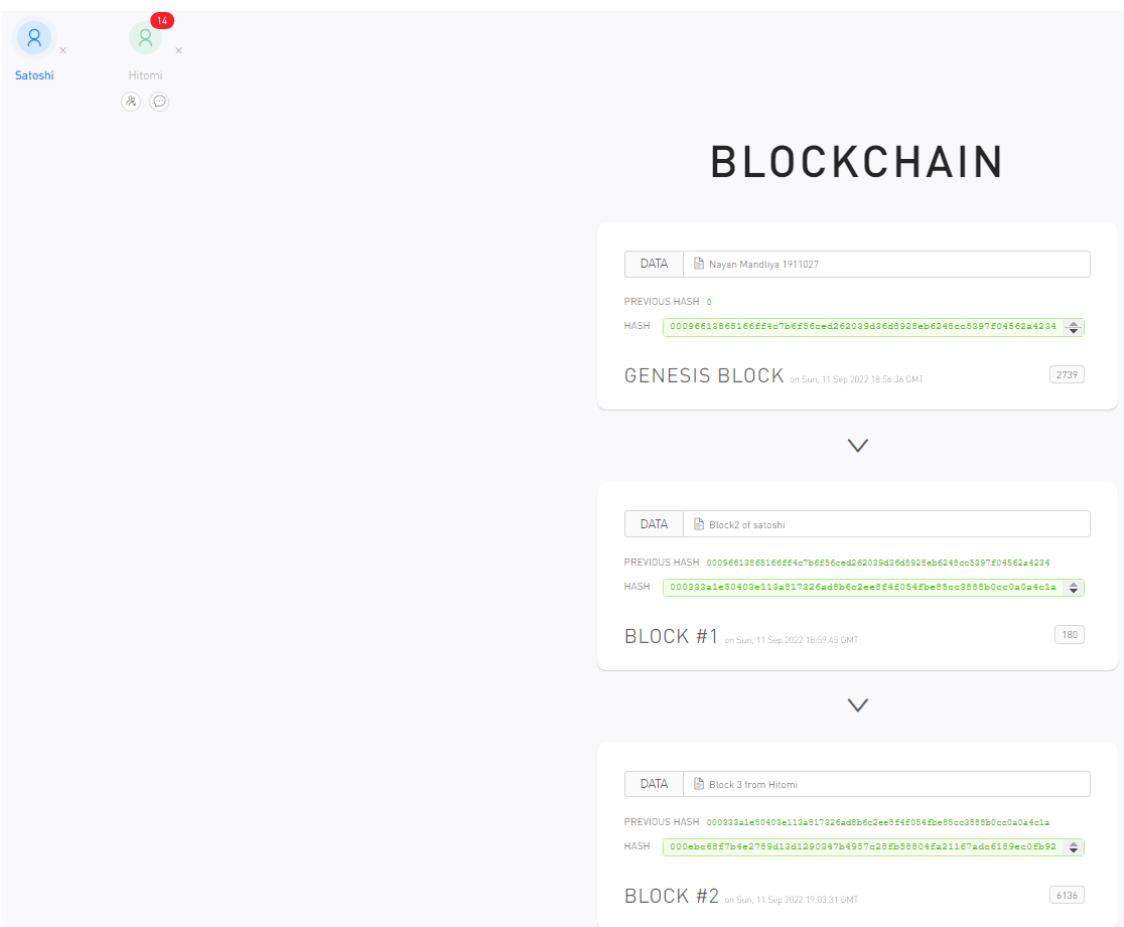

5) As seen from the image given above when we connected both the peers entire blockchain of peer 1 is available to peer 2 also. Now we will add a block in peer2 blockchain.

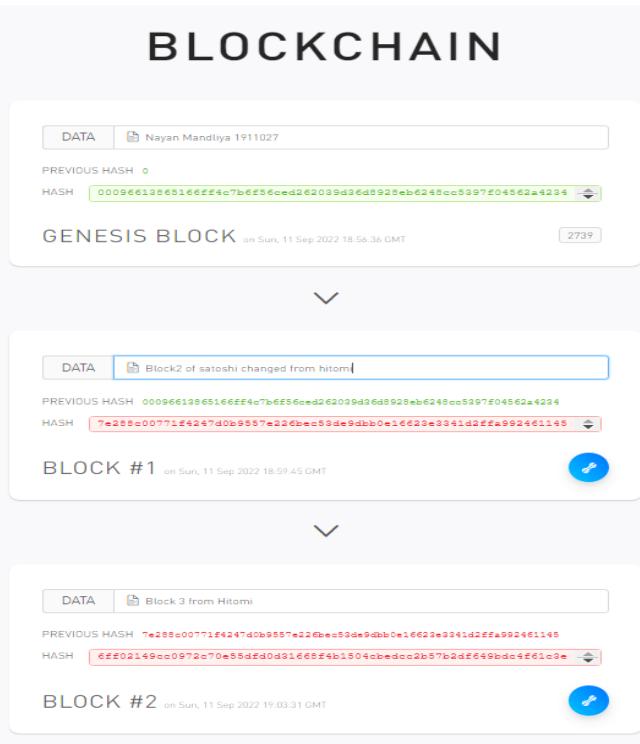

6) This block will also get added to the peer 1 blockchain.

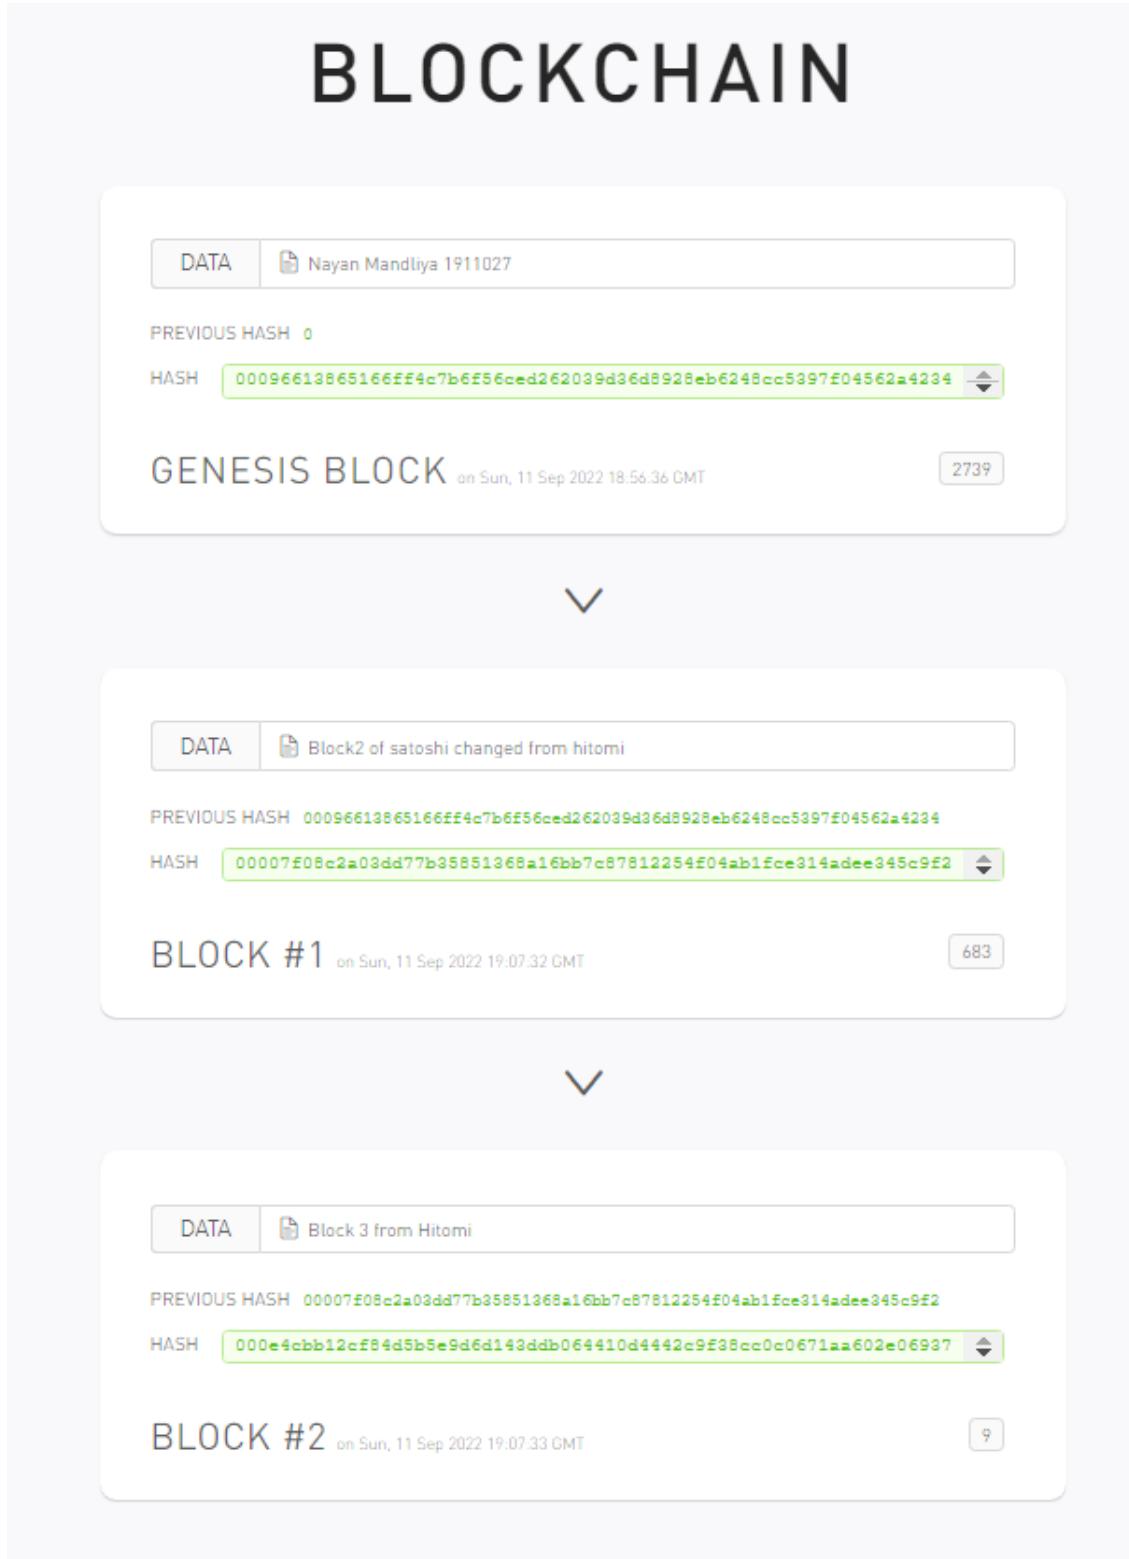

**Department of Computer Engineering**

7) Now as data of block #1 is changed so all the blocks after block #1 (including block #1) has to be mined again.

8) After mining, the blockchain again becomes valid.

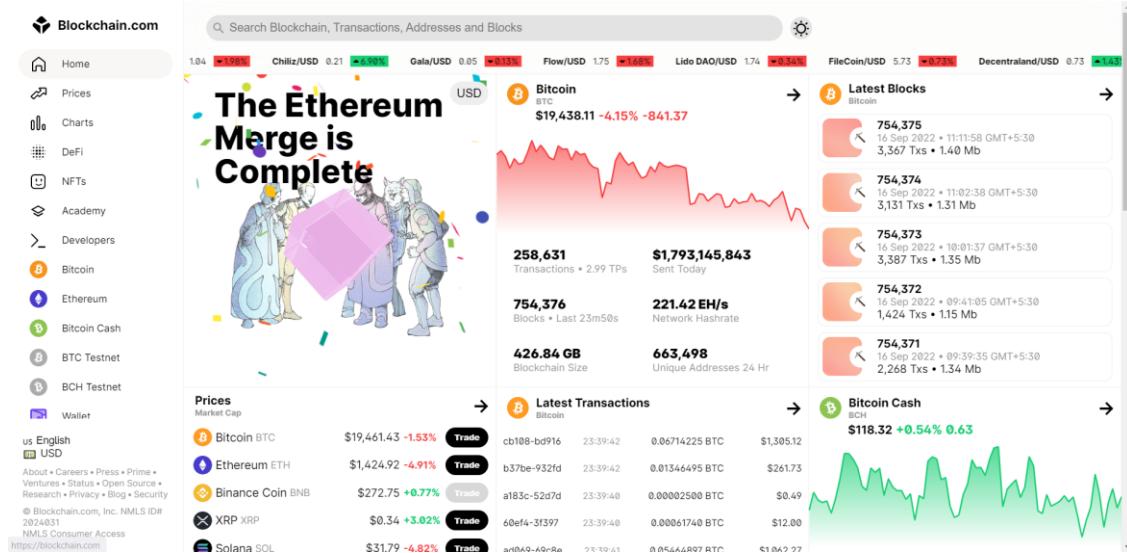

#### Block explorer – Bitcoin: [Link](#)

1) Bitcoin blockchain is a very wide network consists of thousands of block linked one after another. Despite of this huge network every information related to a particular

## Department of Computer Engineering

block is easily using block explorers. Transactions, block numbers, bitcoins transferred, etc everything can be easily checked by usign the blockchain explorers available.

2) On the top of the page you can search for any valid block numbers in the bitcoin blockchain. Now let us look at the genesis block(block number 0) of the bitcoin blockchain

The screenshot shows the search results for "0" on the Blockchain.com website. At the top, there's a search bar with the placeholder "Search for things like address, transaction, block". Below it, a button says "All Blockchains" with a dropdown arrow, and a blue "Search" button. The main content area shows three results for "Block 0":

- BTC Block**
- ETH Block**
- BCH Block**

Below these results is a red link labeled "View testnet results".

3) As seen from the results of the search the description of block number 0 is visible. The date when it is added to the chain and by whom it is added is also seen in the description. It also contains the number of blocks added in the chain after the first i.e. the genesis block. Reward received by the miner after adding this block in the bitcoin network is also available with the description of amount transferred to miners address.

The screenshot shows the detailed description for "Block 0" on the Blockchain.com website. At the top, it says "Block 0" with a blue "USD" button. Below it, a note says "This block was mined on January 03, 2009 at 11:45 PM GMT+5:30 by Unknown. It currently has 754,376 confirmations on the Bitcoin blockchain." Further down, it states "The miner(s) of this block earned a total reward of 50.00000000 BTC (\$972,662.00). The reward consisted of a base reward of 50.00000000 BTC (\$972,662.00) with an additional 0.00000000 BTC (\$0.00) reward paid as fees of the 1 transactions which were included in the block. The Block rewards, also known as the Coinbase reward, were sent to this address." At the bottom, it says "A total of 0.00000000 BTC (\$0.00) were sent in the block with the average transaction being 0.00000000 BTC (\$0.00)."

4) A table will be displayed at the bottom containing more information related to the block that is searched. Hash shows the has of the block header, confirmations shows the number of blocks added after the block, timestamps shows the time at which the block is inserted, height shows the number of blocks before this block, name of the

**Department of Computer Engineering**

miner, number of transactions, nonce used to calculate block hash to satisfy proof of work, block reward, etc.

12) Historical price trends, mining trends, network activity, etc can also be seen in charts section.

### Blockchain Charts

The most trusted source for data on the bitcoin blockchain

13) Overview of the current statistics contains the price related information related to the bitcoin. Individual charts can also be seen by navigating to any of the available charts.

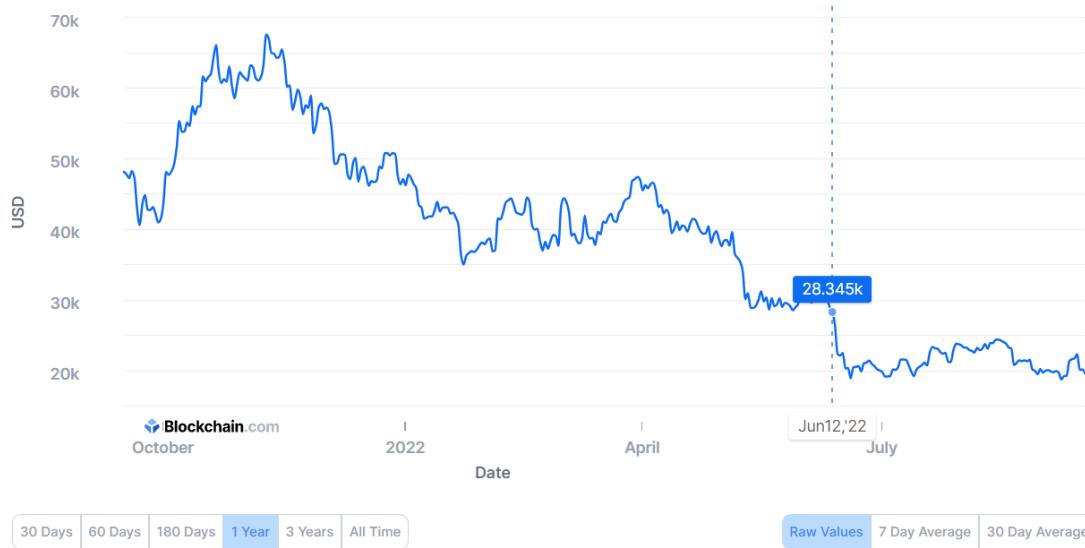

**Department of Computer Engineering**

**Currency Statistics**

**Market Price (USD)**

The average USD market price across major bitcoin exchanges.

- 14) Following are all the charts which are available on the bitcoin explorer.

**Department of Computer Engineering**

### Average Block Size (MB)

The average block size over the past 24 hours in megabytes.

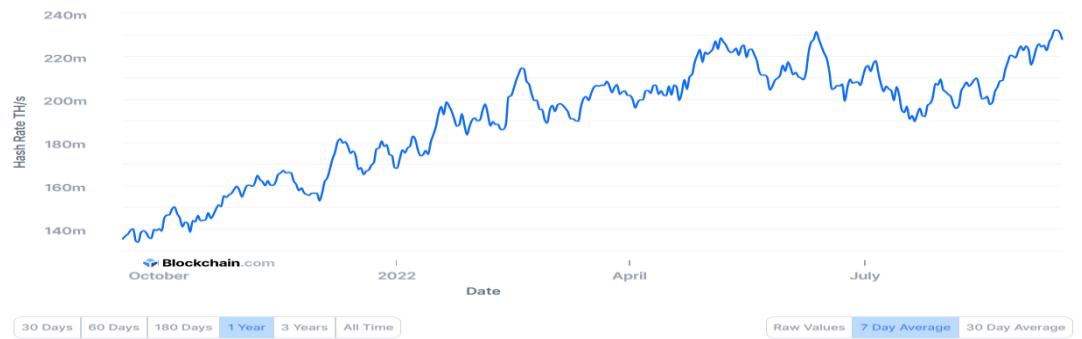

### Mining Information

### Total Hash Rate (TH/s)

The estimated number of terahashes per second the bitcoin network is performing in the last 24 hours.

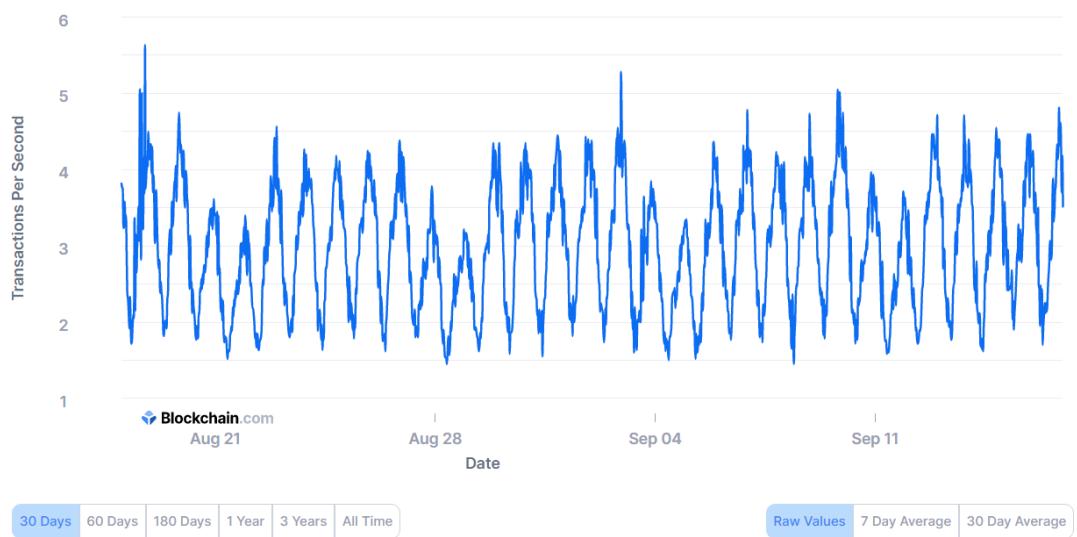

**Department of Computer Engineering**

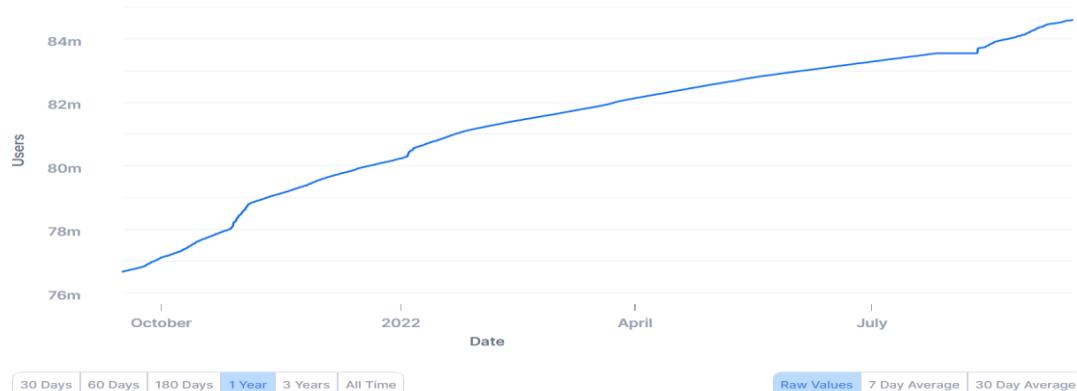

### Transaction Rate Per Second

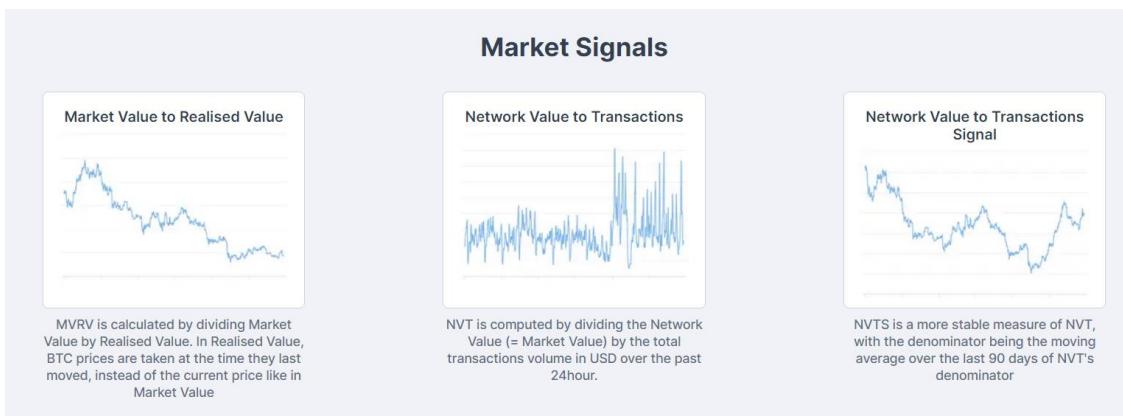

The number of transactions added to the mempool per second.

### Blockchain.com Wallets

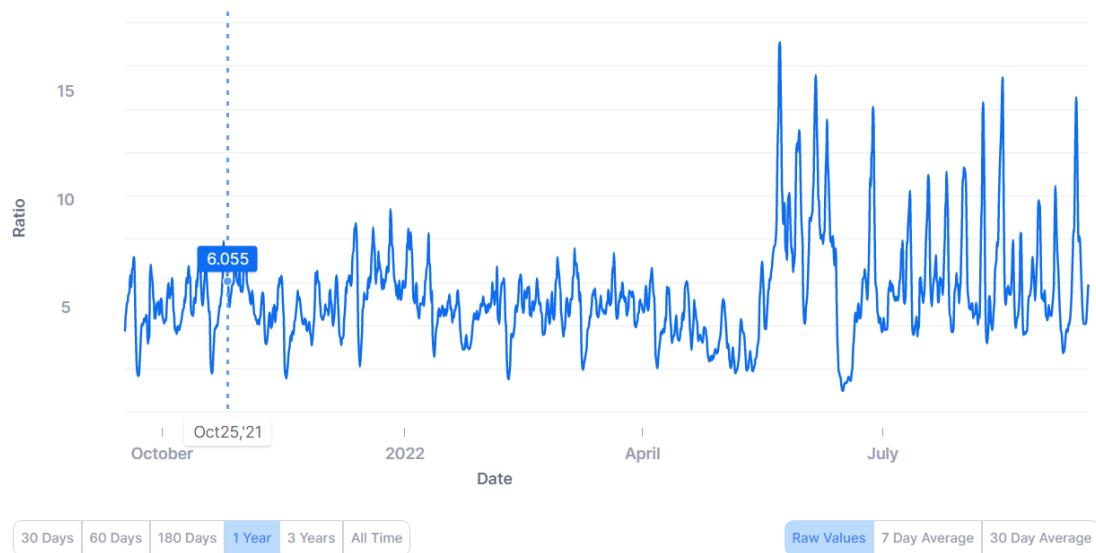

The total number of unique Blockchain.com wallets created.

## Network Value to Transactions

NVT is computed by dividing the Network Value (= Market Value) by the total transactions volume in USD over the past 24 hours.

### Block explorer – Ethereum: [Link](#)

1) Out of bunch of cryptocurrencies available in market, most of the cryprocurencies internal details can be easily seen with the help of block explorers. Like bitcoin ethereum blocks information can also be seen with the help of link mentioned above.

The screenshot shows the Etherscan Ethereum Blockchain Explorer homepage. Key statistics displayed include:

- ETHER PRICE:** \$1,419.05 @ 0.07158 BTC (-2.46%)
- MARKET CAP:** \$171,025,691,177.00
- TRANSACTIONS:** 1,713.84 M (18.6 TPS)
- MED GAS PRICE:** 5 Gwei (30.15)
- LAST FINALIZED BLOCK:** 15553225
- LAST SAFE BLOCK:** 15553257
- ETHERUM TRANSACTION HISTORY IN 14 DAYS:** Shows a line graph of transaction volume from Sep 2 to Sep 16.

Below these, there are sections for "Latest Blocks" and "Latest Transactions".

## **Department of Computer Engineering**

2) Ethers blockchain contains some similar fields like bitcoin such as height, timestamp, transactions, mined by, block reward, etc but it also contains other fields like uncles reward which is obtained if 2 miners are mining the same transactions, difficulty level (proof of work now changed to proof of stake), gas used which is the amount of energy required to insert the block into the ethereum main net.

Block #0	
Overview	Comments
⑦ Block Height:	0 <a href="#">0</a> <a href="#">&lt;</a> <a href="#">&gt;</a>
⑦ Status:	<span>Finalized</span>
⑦ Timestamp:	⑧ 2605 days 21 hrs ago (Jul-30-2015 03:26:13 PM +UTC)
⑦ Transactions:	<a href="#">8893 transactions</a> and 0 contract internal transaction in this block
⑦ Mined by:	0x00(Null Address: 0x000...000) in 15 secs
⑦ Block Reward:	5 Ether
⑦ Uncles Reward:	0
⑦ Difficulty:	17,179,869,184
⑦ Total Difficulty:	17,179,869,184
⑦ Size:	540 bytes
⑦ Gas Used:	0 (0.0%)
⑦ Gas Limit:	5,000
⑦ Extra Data:	0000N000p030000z800000 (Hex:0x11bbe8db4e347b4e8c937c1c8370e4b5ed33ad3db69cbdb7a38e1e50b1b82fa)

3) Other information such as the price of the ether when this block was mined, hash of the block, hash of the parent block (block before this) as block under consideration is genesis block so parent hash is all 0's, the combined hash of all uncles for a given parent defining the Sha3Uncles, StateRoot – The root hash of Merkle trie which stores the entire state of the system and the nonce – A value used to demonstrate proof-of-work for a block by the miner.

4) By navigating to all the transactions inside the block we can see all the information related to all the transactions in the block under consideration. From and to addresses of transfer of ether are also available with the number of ethers transferred.

**Department of Computer Engineering**

**Department of Computer Engineering**

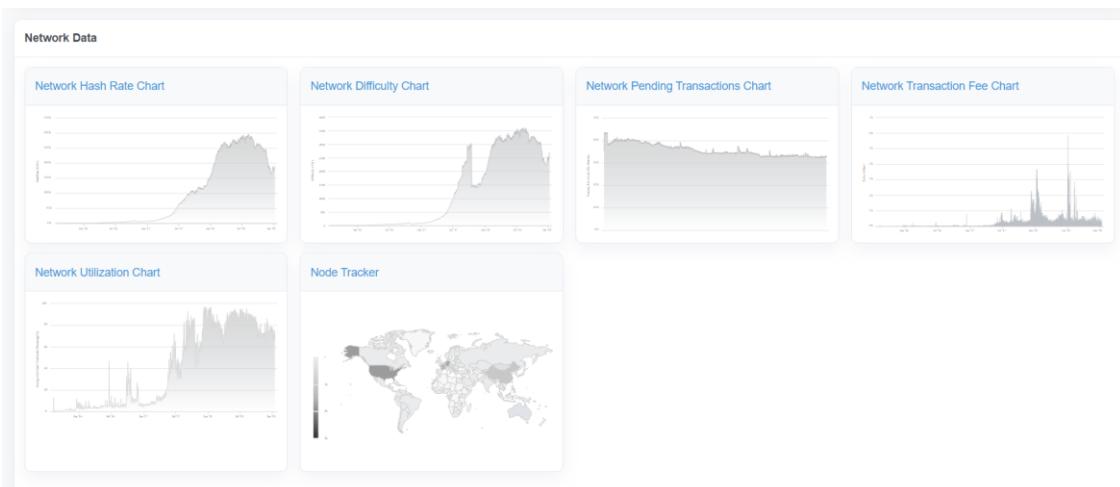

7) This is a special feature available in ethereum block explorer which is the amount of time required to make number of blocks which is mentioned by the user. If the block number entered by the user is greater than the number of blocks in the blockchain then this explorer will give you the details of when the particular block will be available in the ethereum mainnet.

8) Like bitcoin, ethereum block explorer also provides the historical data of the ethereum in terms of charts which can be seen in the charts section. Market data, Blockchain data, network data, etc are available in the charts section.

**Department of Computer Engineering**

9) There is a concept of smart contracts (A smart contract is a computer program or a transaction protocol that is intended to automatically execute, control or document legally relevant events and actions according to the terms of a contract or an agreement) in ethereum, information related to that is also available with the name of the compiler, version, balance, transactions, date of verification, license, etc.

### Testnetworks: [Link](#)

1) Besides the main network of the cryptocurrencies, test networks are provided so that developers can test their blockchains on these networks. For using a testnetwork we must have a wallet which will be storing the list of test networks available with the account and the amount of cryptocurrencies in the respective test networks. For creating a cryptocurrency wallet metamask is used which is used as a browser extension.

**Department of Computer Engineering**

The screenshot shows the MetaMask extension page on the Chrome Web Store. At the top, there's a navigation bar with 'chrome web store' and a user icon 'n.mandliya@somaiya.edu'. Below the navigation, the URL 'Home > Extensions > MetaMask' is visible. The main content features the MetaMask logo (an orange fox head), the text 'MetaMask' and 'metamask.io', a rating of '★★★★★ 2,700', and 'Productivity | 10,000,000+ users'. A prominent blue button on the right says 'Add to Chrome'.

- 2) Just add metamask to chrome and on the right of the search bar of chrom in the extensions section just enable the metamask extension.

## Welcome to MetaMask

Connecting you to Ethereum and the Decentralized Web.

We're happy to see you.

**Get Started**

- 3) Click on get started, and create a wallet by selection the particular option.

### New to MetaMask?

No, I already have a Secret Recovery Phrase

Import your existing wallet using a Secret Recovery Phrase

**Import wallet**

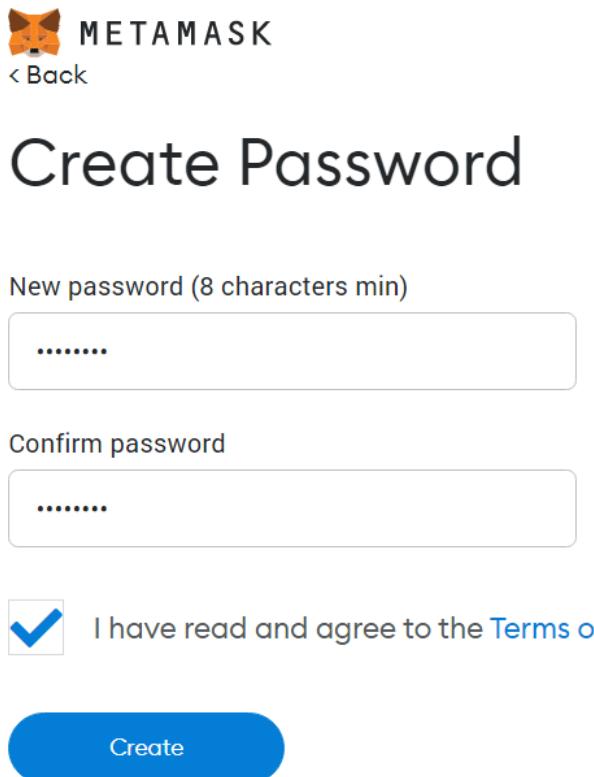

Yes, let's get set up!

This will create a new wallet and Secret Recovery Phrase

**Create a Wallet**

**Department of Computer Engineering**

4) Metamask will ask for a password for account, enter the password and click create wallet.

5) A demo video on how to use wallet and security policy is shown click on next to go to next screen.

The screenshot shows the Metamask interface for securing a wallet. At the top left is a fox icon and the word 'METAMASK'. The main title 'Secure your wallet' is centered. Below it is a video player showing a pink gradient triangle on a white background. The video progress bar shows '0:00 / 1:35'. To the right is a sidebar with the following sections:

- What is a Secret Recovery Phrase?**

Your Secret Recovery Phrase is a 12-word phrase that is the “master key” to your wallet and your funds
- How do I save my Secret Recovery Phrase?**
  - Save in a password manager
  - Store in a bank vault
  - Store in a safe deposit box
  - Write down and store in multiple secret places
- Should I share my Secret Recovery Phrase?**

Never, ever share your Secret Recovery Phrase, not even with MetaMask!
- If someone asks for your recovery phrase they are likely trying to scam you and steal your wallet funds.**

At the bottom of the sidebar is a 'Next' button.

**Department of Computer Engineering**

- 6) A secret recovery phrase is available with the account and which is unique for every account, store the shown security phase because it will be used in future.

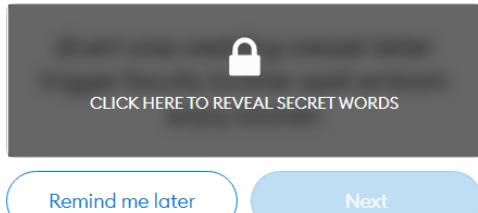

< Back

## Secret Recovery Phrase

Your Secret Recovery Phrase makes it easy to back up and restore your account.

**WARNING:** Never disclose your Secret Recovery Phrase. Anyone with this phrase can take your Ether forever.

Tips:

Store this phrase in a password manager like 1Password.

Write this phrase on a piece of paper and store in a secure location. If you want even more security, write it down on multiple pieces of paper and store each in 2 - 3 different locations.

Memorize this phrase.

Download this Secret Recovery Phrase and keep it stored safely on an external encrypted hard drive or storage medium.

- 7) Choose the words according to the secret phase shown in the previous step.

< Back

## Confirm your Secret Recovery Phrase

Please select each phrase in order to make sure it is correct.

brother

Confirm

**Department of Computer Engineering**

8) Your metamask account is now all set to use.

## Congratulations

You passed the test - keep your Secret Recovery Phrase safe, it's your responsibility!

### Tips on storing it safely

- Save a backup in multiple places.
- Never share the phrase with anyone.
- Be careful of phishing! MetaMask will never spontaneously ask for your Secret Recovery Phrase.
- If you need to back up your Secret Recovery Phrase again, you can find it in Settings -> Security.
- If you ever have questions or see something fishy, contact our support [here](#).

\*MetaMask cannot recover your Secret Recovery Phrase. [Learn more](#).

All Done

9) After the wallet is created home page will show the amount of cryptocurrency available in the wallet, account address, activity and assets associated with the account and at the top of the screen there is dropdown which shows the the number of test networks associated with the account.

A screenshot of the Metamask web interface. At the top, it says "Ethereum Mainnet". Below that, it shows "Account 1" with the address "0xa82...F62c". It displays "0 ETH" and "\$0.00 USD". There are three buttons: "Buy", "Send", and "Swap". Below this, there are tabs for "Assets" and "Activity". Under "Assets", it shows "0 ETH" and "\$0.00 USD". There is a link to "Import tokens" if tokens are not visible. At the bottom, it says "Need help? Contact [MetaMask Support](#)".

## Networks

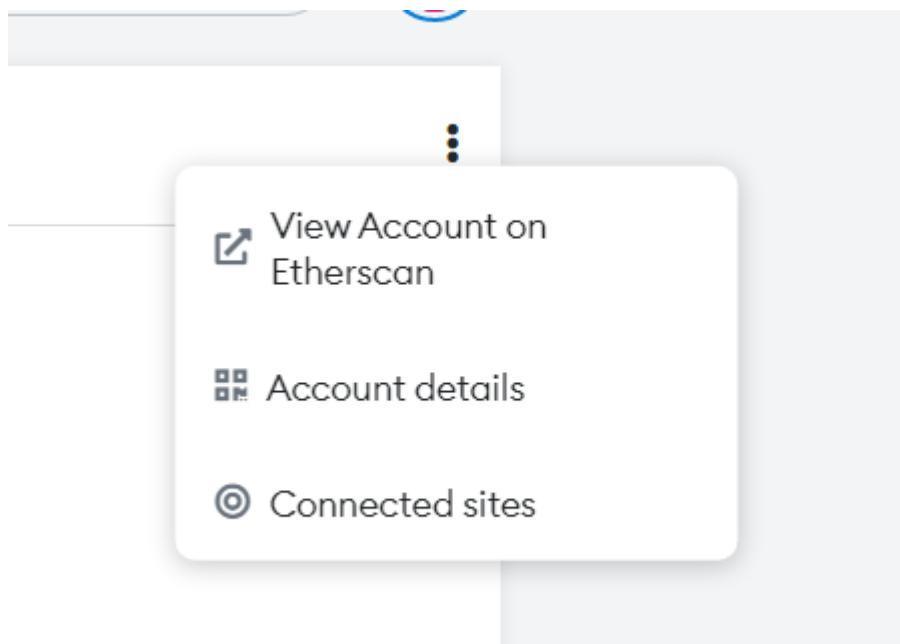

[Show/hide](#) test networks

[Dismiss](#)

- Ethereum Mainnet
- Ropsten Test Network
- Kovan Test Network
- Rinkeby Test Network
- Goerli Test Network
- Localhost 8545

[Add Network](#)

- 10) These are the options that are available with respect to any account created on metamask.

**Department of Computer Engineering**

11) There are a number of faucets available which will provide with fake cryptocurrencies. Moonborrow is a faucet which will provide the ropsten ethers. For taking the fake ethers from moonborrow, enter address of the wallet in the input section and click on claim.

 Thinklair Ropsten Ether Faucet

Find my videos concerning blockchain on this [YouTube channel](#), or follow me on [LinkedIn](#)

To use the faucet you need to login with a Google account. [LOGIN](#)

Ethereum address\*

[CLAIM](#)

No transactions recorded against your account yet.

This Ropsten ether faucet is running on the Ropsten network. To prevent malicious actors from exhausting all available funds or accumulating enough rETH to mount long running spam attacks, requests require authentication with a Google account. Anyone with such an account may request funds within the permitted limits.

A request can be made every 24 hours, and 0.0001% of the current rETH funds held will be paid out to the address provided. The total funds are currently 35121826 rETH.

Why not show your support for this faucet by purchasing a copy of my book, **Move Over Brokers Here Comes The Blockchain**, from [Amazon in softback or ebook formats](#), or [Lulu for a hardback copy](#)? It's a win-win situation – you get some entertaining and educational reading material, and I make another book sale.

**Department of Computer Engineering**

**2. Explain your program logic, classes and methods used.**

→ The methods used internally in the blockchain are as follows:

- 1) Hashing: A hash is a mathematical function that converts an input of arbitrary length into an encrypted output of a fixed length. Thus regardless of the original amount of data or file size involved, its unique hash will always be the same size. Moreover, hashes cannot be used to "reverse-engineer" the input from the hashed output, since hash functions are "one-way" (like a meat grinder; you can't put the ground beef back into a steak). Still, if you use such a function on the same data, its hash will be identical, so you can validate that the data is the same (i.e., unaltered) if you already know its hash. Hashing is also essential to blockchain management in cryptocurrency.
- 2) Authenticating the transaction: This is the first step that takes place in the process. Authenticating a transaction is an important step that forms the building block. Although blockchain networks are free from government control, the transactions are still authenticated using cryptographic keys. Users are required to enter “passwords” for proceeding with the transactions. Cryptographic keys provide access to the account and wallet system. These keys work like unique passwords and serve the purpose of strengthening security.
- 3) Authorising the transaction: Post transaction agreement, the blocks are authorised prior to their addition in the blockchain network. Public blockchains follow the voting process. Before finally letting a block in, a message is sent to different blockchains in the public network. When the majority of nodes agree for the new transaction a new block is thus added. The main owners of the blockchain network verify the transactions via “proof of work”. Proof of work refers to the cash rewards that owners of the blockchain provide miners for solving the hash code.
- 4) Validation: A group of miners collectively share their rewards that they have obtained via solving the mathematical problems. As the network size increases it becomes even more difficult to add blocks. The equation keeps on expanding in size and further validation keeps getting complex too. Every new block is then validated multiple times before making them a part of the chain. The monopoly soon starts taking in and a lot of blocks are refrained from entering. Power of mining also becomes concentrated in the hands of a few.

**3. Explain the Importance of the approach followed by you**

→ Blockchain technology is something that cannot be understood without actually watching a demo of its working, so online platforms providing these services are of great importance while working with blockchain. Some other advantages include:

- Online platforms for learning blockchain provide good UI/UX, which is very useful for any beginner to begin learning blockchain.

**Department of Computer Engineering**

- Some platforms also provide some kind of demo in video format to make users comfortable with the use of the platform. All the platforms used to complete this experiment contain a demo in video format.
- To test any blockchain network, we need some fake entities to test the blockchain, and online platforms provide that also.
- Before learning blockchain, the concepts used under blockchain have to be learned first. All the prerequisite information can also be gathered from the platforms used above.
- To explore all the things possible with blockchain, we need to go through tonnes of websites, but platforms describing blockchain contain all the information related to blockchain.

**Conclusion:- Understood the concept of blockchain and its working. The internal contents of the blocks of the blockchain are also explored using various block explorers. I also tried different test networks with the help of metamask and fake cryptocurrencies built on Ethereum. Explored virtual labs to get more insights into the components and workings of the blockchain.**

**Virtual labs:**

**Virtual lab 1 – Three Pillars of Blockchain: [Link](#)**

**Three Pillars of Blockchain**

**Aim**

In this experiment, the user will learn about Blockchain and its three pillars that are decentralization, transparency & immutability. The simulator will also demonstrate the relation between blocks and chain. Apart from that, he/she will also be able to explain and apply the concepts of blockchain with the help of open and distributed ledger.

## Pre Test

**What is a blockchain?**

- a : A type of cryptocurrency
- b : A distributed ledger on a peer to peer network
- c : An exchange
- d : A centralized ledger

**Who created Bitcoin?**

- a : Samsung
- b : John McAfee
- c : Satoshi Nakamoto
- d : None of the above

**What is a miner?**

- a : Computers that validate and process blockchain transactions
- b : A person doing calculations to verify a transaction
- c : A type of blockchain
- d : An algorithm that predicts the next part of the chain

**What is a genesis block?**

- a : A famous block that hardcoded a hash of the Book of Genesis onto the blockchain
- b : The 2nd transaction of a blockchain
- c : The first block of a Blockchain
- d : None of the above

**According to the blockchain mechanism, which statement is true?**

- a : All the people receive transactions simultaneously
- b : Only the person receives the transaction
- c : Both are correct
- d : None of these

**Submit Quiz**

5 out of 5

### 1) Blockchain valid chain:

Simulation

Pop Up Procedure

The interface shows a diagram of four red circles labeled A, B, C, and D. Circle A is at the top left, B is at the top right, C is at the bottom left, and D is at the bottom right. A horizontal line connects A to B, and another horizontal line connects C to D. A vertical line connects B to D. Below the diagram are three buttons: 'Validate' (green), 'Reset' (blue), and 'Hint' (red).

**Blockchain valid chain exercise**

**INSTRUCTIONS:**

Connect the blocks(circles) in the order specified below to make a valid chain!

1. B -> D
2. D -> C
3. A -> B

#1 Notification  
It is valid

### 2) Open ledger:

The interface has two main sections. On the left, under 'Options', there are fields for User-A (name: Block 1, amount: 100), User-B (name: Block 2, amount: 50), and User-C (name: Block 3, amount: 10). Each has a 'Submit' button. Below these is a question 'Do you wish to continue?' with radio buttons for Yes and No.

**OPEN LEDGER**

**INSTRUCTIONS:**

1. Enter Name and amount.
2. User A gets money from the Bank.
3. Click on "Submit" button to accept the transaction.
4. Now enter name and amount whome you want to send the transaction
5. Amount which you enter in the second and thrid transaction should be less that or equal to the amount which you received.

From : System  
To : Block 1  
Amount : 100

From : Block 1  
To : Block 2  
Amount : 50

From : Block 2  
To : Block 3  
Amount : 10

**Department of Computer Engineering**

**3) Distributed ledger:**

**DISTRIBUTION**

**INSTRUCTIONS:**

1. Click on the Block A at the Ledger and then click on Node A Node B and Node C.
2. Now click the "Validate" button.
3. A popup shows a message "Valid!".
4. Now do the same for Block B.
5. Click on "Validate" button. A message will display saying "Valid!".
6. Therefore the blocks from the Ledger are thus distributed among all the nodes i.e Node A, Node B and Node C.

**Initiate Immutability Experiment**

Block A	Block B
A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20

#2 Notification		
Different number of blocks in nodes, invalid!		
D -> C Amount: 20		

Node A	
Block A	Block B
A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20

Node B	
Block A	Block B
A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20

Node C	
Block A	
A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	

**VALIDATE    RESET**

**DISTRIBUTION**

**INSTRUCTIONS:**

1. Click on the Block A at the Ledger and then click on Node A Node B and Node C.
2. Now click the "Validate" button.
3. A popup shows a message "Valid!".
4. Now do the same for Block B.
5. Click on "Validate" button. A message will display saying "Valid!".
6. Therefore the blocks from the Ledger are thus distributed among all the nodes i.e Node A, Node B and Node C.

**Initiate Immutability Experiment**

Block A	Block B
A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20

#3 Notification		
Valid!		
B -> C Amount: 20 B -> C Amount: 20		

Block A	Block B	Block C
A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20

Node B		
Block A	Block B	Block C
A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20

Node C		
Block A	Block B	Block C
A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20	A -> B Amount: 10 B -> C Amount: 20 B -> C Amount: 20

**VALIDATE    RESET**

**Department of Computer Engineering**

**4) Immutability:**

End of Experiment

**Immutability**

**INSTRUCTIONS:**

1. Try deleting block of Node A. 2. Now click the "Validate" button.
3. Error occurs on Node A (It turns red).
4. Now delete remaining blocks of Node A and then click on the "Validate" button.
5. The blocks get deleted.
6. Therefore the blocks of Node A are deleted which tells us that atleast 51% Consensus.

VALIDATE

### Post Test

**Which of these statements are true for open ledger?**

- a : Every one has copy of ledger.
- b : Ledger can be viewed by anyone.
- c : Ledger is mutable.
- d : None Of these

**Which of the following is true for distributed ledger?**

- a : Everyone has a copy of ledger
- b : There is one copy of the ledger
- c : Ledger is mutable.
- d : None of these

**A miner has completed the mining what will be the next step?**

- a : Wait for second miner to complete
- b : Wait for all members to complete
- c : Validate the transaction and add it to the ledger
- d : None of the above

**What is not a ledger type in blockchain?**

- a : Distributed Ledger
- b : Open Ledger
- c : Both a and b
- d : None of these

**How can a user successfully modify a blockchain?**

- a : It is immutable
- b : By simply deleting the block
- c : By use of consensus algorithm
- d : None of the above

**Submit Quiz**

5 out of 5

**Virtual lab 2 – Mining in Blockchain: [Link](#)**

Mining in Blockchain

Aim

In this experiment, the user will learn about mining in blockchain i.e. how a transaction is validated and added into a blockchain. He/she will learn how the process of hashing helps in validation of a block. He/she will also get to know which miner is rewarded when a block is validated and added to the blockchain.

**Pre Test**

**Which key is used for Asymmetric Cryptography?**

- a : Public Key
- b : Private Key
- c : Both public and private keys
- d : None of the above

**The full form of SHA is?**

- a : Social Hash Algorithm
- b : Secure Hash Algorithm
- c : System Hash Algorithm
- d : None of the above

**Which of the following is a full form of P2P?**

- a : Peer to Peer
- b : Public key to Public key
- c : Private key to Public key
- d : None of the above

**Where can you reserve your cryptocurrency?**

- a : Reserve Bank of India
- b : Wallet
- c : Compact Disk (CD)
- d : Both (a) and (b)

**Identify the correct statement?**

- a : Blockchain is centralized
- b : Blockchain is mutable
- c : Both a and b
- d : None of these

**What is a miner?**

- a : A type of blockchain
- b : An algorithm that predicts the next part of the chain
- c : A person doing calculations to verify a transaction
- d : Computers that validate and process blockchain transactions

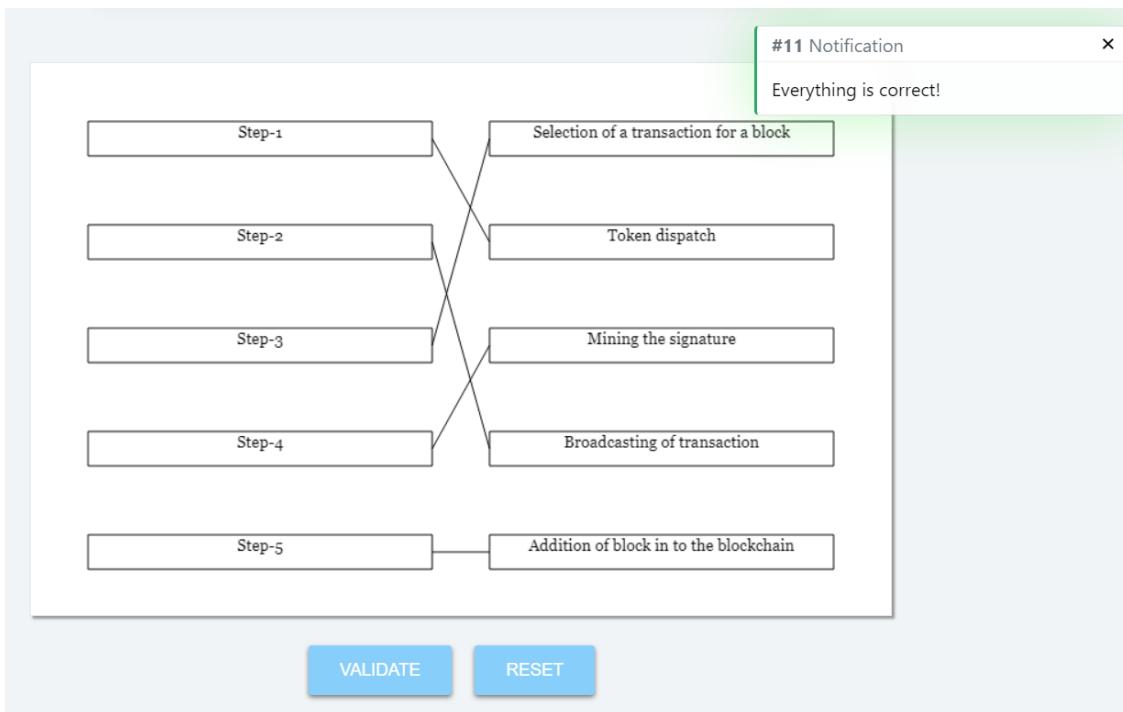

**What is the process of creating new bitcoins popularly known as?**

- a : Finding
- b : Panning
- c : Sourcing
- d : Mining

**Submit Quiz**

7 out of 7

Department of Computer Engineering

**Instructions:**

- 1. Enter the name of User-A(Sender) and User-B(Reciever) to send transaction.**
- 2. Now click on the button "ADD TO BLOCK".**
- 3. The details you entered will appear on the block.**
- 4. Now click on the button "START MINING PROCESS".**
- 5. Mining process will start. Miner A,Miner B and Miner C will start calculating the proper Hash .**
- 6. One of the miner completes the mining process and other miners confirm the hash calculated.**
- 7. Click on "RESET" button to do the experiment again.**

Before mining:

## Mining Process

From  To  Amount

**ADD TO BLOCK**   **START MINING PROCESS**   **RESET**

k.

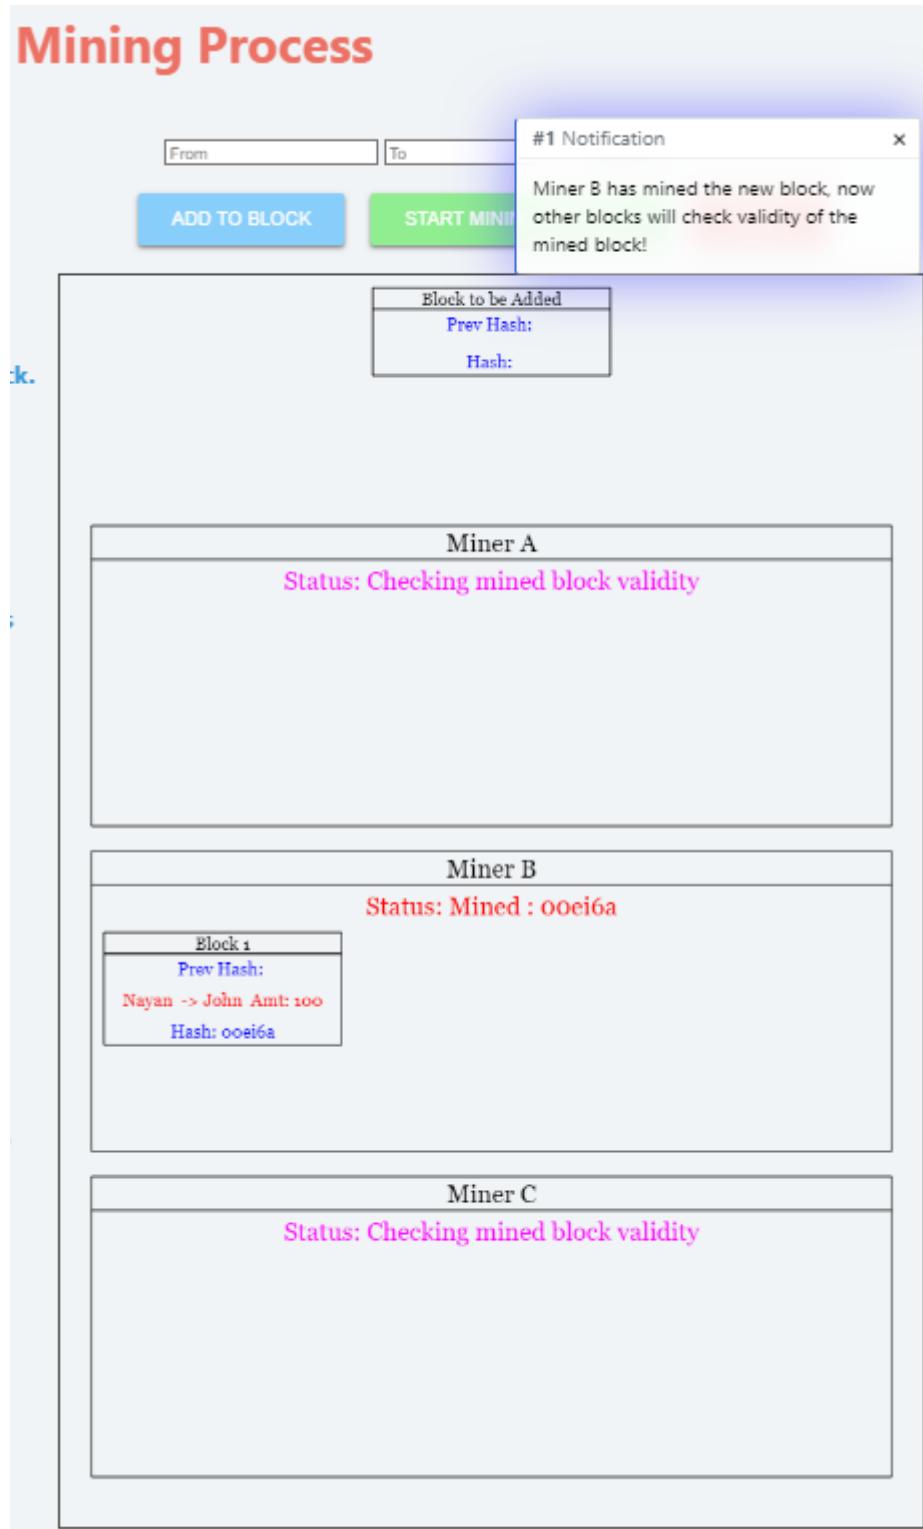

Block to be Added
Prev Hash: Nayan -> John Amt: 100 Hash:

Miner A  
Status: Idle

Miner B  
Status: Idle

Miner C  
Status: Idle

After mining (hash calculated by one of the miners):

After mining (block published to all):

## Mining Process

The interface shows a central mining area with three miner boxes below it. Each miner box contains a status section and a block details section.

- Miner A:** Status: Idle. Block 1: Prev Hash: ooei6a; Nayan -> John Amt: 100; Hash: ooei6a.
- Miner B:** Status: Idle. Block 1: Prev Hash: ooei6a; Nayan -> John Amt: 100; Hash: ooei6a.
- Miner C:** Status: Idle. Block 1: Prev Hash: ooei6a; Nayan -> John Amt: 100; Hash: ooei6a.

Two notifications are displayed above the miners:

- #2 Notification: Other blocks have validated the newly mined block, so they have added it to their ledgers now! Miner B has also been given miner reward as a result.
- #1 Notification: Miner B has mined the new block, now other blocks will check validity of the mined block!

Another transaction:

## Mining Process

**#6 Notification**

Other blocks have validated the newly mined block, so they have added it to their ledgers now! Miner C has also been given miner reward as a result.

**#5 Notification**

Miner C has mined the new block, now other blocks will check validity of the mined block!

## Mining Process

**Department of Computer Engineering**

**Post Test**

**Which statement is correct?**

- a : Mining is a process of adding transactions in a ledger
- b : SHA-256 is the only cryptographic algorithm used in blockchain
- c : Both a and b
- d : None Of the above

**Which is not an advantage of blockchain technology?**

- a : Anonymity & Privacy
- b : Mutability
- c : Low transaction cost
- d : Digital freedom and decentralization

**Initial miner has completed the mining process, what will be the next step?**

- a : Wait for the next miner to complete
- b : Terminate the process
- c : Validate the transaction and add it to the ledger
- d : None of the above

**Which of the following listed is not involved in mining?**

- a : Hash Value
- b : Hash function
- c : Sender and Reciever
- d : None of the above

**Which statement is not correct?**

- a : Mining is not done in blockchain
- b : Ledger is related to the process of mining
- c : Both a and b
- d : None of the above

**The block in the blockchain consist of?**

- a : A hash pointer to the previous block
- b : Timestamp
- c : List of transactions
- d : All of the above

**The main advantage of immutability is\_\_\_\_\_.**

- a : Scalability
- b : Improved Security
- c : Tamper Proof
- d : Increased Efficiency

**Department of Computer Engineering**

**Virtual lab 3 – Proof of Work (PoW) & Proof of Stake (PoS): [Link](#)**

**Proof of Work (PoW) & Proof of Stake (PoS)**

**Aim**

In this experiment, the user will learn about Proof of Stake and Proof of Work. The simulator will demonstrate the working of both these algorithms by one short example of each concept. Apart from that, he/she will also be able to recall concepts with the help of a Fill in the Blanks exercise.

**Pre Test**

**Which statement is not correct?**

- a : Mining is related to PoW
- b : Mining is related to PoS
- c : PoS is an alternative to PoW
- d : None of the above

**Which statement are correct?**

- a : Ledger is a component of Mining
- b : Ledger is not a concept of Mining
- c : Hashing is related to ledger
- d : PoW is Proof of work

**How mining is done?**

- a : Through Hashing
- b : Through Adding to blocks, Hashing
- c : Through Adding of blocks, Hash of current block, Hash of Previous block
- d : None of the above

**Full form of PoS is?**

- a : Privacy of Stake
- b : Proof of Stack
- c : Proof of Stake
- d : None of the above

**Pillars of blockchain are?**

- a : Centralization, Mutability, Transparency
- b : Decentralization, Immutability, Transparency
- c : Confidentiality, Integrity, availability
- d : None of these

**What is a hash?**

- a : A type of blockchain
- b : An algorithm that predicts the next part of the chain
- c : Function that convert input string into encrypted output
- d : None of the above

**What is the process of creating new bitcoins popularly known as?**

- a : Finding
- b : Panning
- c : Mining
- d : None of the above

**Submit Quiz**

7 out of 7

**Department of Computer Engineering**

**Proof of work puzzle:**

**Initiate Proof of Stake Task**

**Construct correct sequence of events for Proof of Work Algorithm**

You are given a series of events, construct the correct sequence of events that takes place in Proof of Work Algorithm Click on the code blocks in the yellow area to add them to grey area(final solution area). Click on validate button on the bottom when you think that you're done.

**Final Solution:**

After validation of hash, miners adds the block to their blockchain(ledger)

One of the nodes(miner) is chosen for validation, known as validator node, based on staked amount by each node.

One of the miner has found the correct hash.

The validator node is given a reward.

Block is ready to be published

Other Miners validates the hash that was generated by one of the miner.

Other nodes adds the block validated by validator node in their blockchain

Miner who found the correct hash, tells it to the other miners.

Miners starts finding correct hash for the new block(mining).

Miner who found the correct hash, is given mining reward.

The chosen node validates the block and tells it to other nodes.

#8 Notification

Block is ready to be published

Correct!

Miners starts finding correct hash for the new block(mining).

One of the miner has found the correct hash.

Miner who found the correct hash, tells it to the other miners.

Other Miners validates the hash that was generated by one of the miner.

After validation of hash, miners adds the block to their blockchain(ledger)

Miner who found the correct hash, is given mining reward.

## Department of Computer Engineering

### Proof of stake activity:

#### 1) Node B added to the chain:

**Proof of Stake**

From  To  Amount

**ADD TO BLOCK** **PUBLISH BLOCK**

Node Name  Amount to stake

**ADD NODE** **RESET**

Block to be Added

Prev Hash:
Hash:

Node A -- Stake Amount: 100

Block A
Prev Hash:
A -> B Amt: 10
B -> C Amt: 20
Hash: oocdefgh

Node B -- Stake Amount: 500

Block A
Prev Hash:
A -> B Amt: 10
B -> C Amt: 20
Hash: oocdefgh

#1 Notification ×

With the addition of new node, chances of other nodes to be selected as validator changes depending on staked amount of each node.

Chance of mining a new block: 17%  
Calculations:  $(100/600) \times 100 = 17\%$

Chance of mining a new block: 83%  
Calculations:  $(500/600) \times 100 = 83\%$

#### 2) New block added (transaction from A to B, amount = 15):

**Proof of Stake**

From  To  Amount

**ADD TO BLOCK** **PUBLISH BLOCK**

Node Name  Amount to stake

**ADD NODE** **RESET**

Block to be Added

Prev Hash:
A -> B Amt: 15
Hash:

Node A -- Stake Amount: 100

Block A
Prev Hash:
A -> B Amt: 10
B -> C Amt: 20
Hash: oocdefgh

Node B -- Stake Amount: 500

Block A
Prev Hash:
A -> B Amt: 10
B -> C Amt: 20
Hash: oocdefgh

#1 Notification ×

With the addition of new node, chances of other nodes to be selected as validator changes depending on staked amount of each node.

Chance of mining a new block: 17%  
Calculations:  $(100/600) \times 100 = 17\%$

Calculations:  $(500/600) \times 100 = 83\%$

**Department of Computer Engineering**

**3) Node A selected as validator node.**

**Proof of Stake**

From  To  Amount

**Block to be Added**

Prev Hash:  
A -> B Amt: 10  
B -> C Amt: 20  
Hash: oocdefgh

**Validating**      Node A -- Stake Amount: 100

Block A  
Prev Hash:  
A -> B Amt: 10  
B -> C Amt: 20  
Hash: oocdefgh

Node B -- Stake Amount: 500

Block A  
Prev Hash:  
A -> B Amt: 10  
B -> C Amt: 20  
Hash: oocdefgh

#2 Notification ×

Node A has been selected as the validator

Chance of mining a new block: 17%  
 Calculations:  $(100/600) \times 100 = 17\%$

Chance of mining a new block: 83%  
 Calculations:  $(500/600) \times 100 = 83\%$

**4) Block published to another node.**

**Proof of Stake**

From  To  Amount

**Block to be Added**

Prev Hash:  
System -> Node A Amt: 5  
Hash: oodS8IRp

**Node A -- Stake Amount: 100**

Block A Prev Hash: A -> B Amt: 10 B -> C Amt: 20 Hash: oocdefgh	Block 2 Prev Hash: oocdefgh A -> B Amt: 15 Hash: oodS8IRp
---	--

Node B -- Stake Amount: 500

Block A Prev Hash: A -> B Amt: 10 B -> C Amt: 20 Hash: oocdefgh	Block 2 Prev Hash: oocdefgh A -> B Amt: 15 Hash: oodS8IRp
---	--

#3 Notification ×

Node A has now validated the block, it will be added to the ledger. Node A will also be given a validator award as a result.

#2 Notification ×

Node A has been selected as the validator

Chance of mining a new block: 17%  
 Calculations:  $(100/600) \times 100 = 17\%$

Chance of mining a new block: 83%  
 Calculations:  $(500/600) \times 100 = 83\%$

Department of Computer Engineering

**Difference between proof of work and proof of stake activity:**

Move the blocks to the correct section
#1 Notification ×  
Everything is correct!

PoS

Chances of verification can vary

Validation of block is performed

Initial amount is required to start with

PoW

Chances of verification does not vary

Mining of block is performed

VALIDATE
RESET

### **Post Test**

**What is Proof of Stake?**

- a : A timestamp
- b : A Consensus protocol
- c : A Cryptographic dimension
- d : None Of the above

**What is Proof Of work?**

- a : A timestamp
- b : A Consensus protocol
- c : A Cryptographic dimension
- d : None of these

**What role does consensus algorithm play in mining?**

- a : Validation
- b : Adding of blocks
- c : Both a and b
- d : None of the above

**Is there, a better algorithm for PoW than SHA-256?**

- a : Yes
- b : No
- c : Can't say

**PoS is an alternative measure of?**

- a : PoW
- b : PoA
- c : PoB
- d : PoC

**Which statement is correct?**

- a : Mining is a mutable option in blockchain
- b : SHA-256 is the only cryptographic algorithm used in blockchain
- c : Both A and B
- d : None of the above

**Which is not an advantage of blockchain technology?**

- a : Anonymity & Privacy
- b : Mutability
- c : Both A and B
- d : None of the above
